List of tables and figures	5
Foreword	8
Abbreviations	9
List of annex tables	10
Chapter 1. Executive Summary	
1.1 Overview	12
1.2 Survey objectives and rationale	12
1.3 Survey period	13
1.4 Report structure and content	13
1.5 Summary of findings	14
Chapter 2. Survey methodology, organization and definitions	
2.1 Survey coverage	20
2.2 Survey sampling	20
2.3 Survey questionnaire, training of senior researchers and data collection	21
2.4 Data processing	22
2.5 Definitions and concepts	23
Chapter 3. Demographic and household characteristics	
3.1 Introduction	28
3.2 Demographic profile	28
3.3 Population size, location and distribution by region	28
3.4 Population age and sex structure	29
3.5 Demographic dependency	30
3.6 Household structure	30
3.7 Female headed households	30
3.8 Education level	31
3.9 School attendance and causes of school drop outs	32
3.10 Literacy level	33
Chapter 4. Socio-economic characteristics of working children and their households, and school attendance	
4.1 Introduction	36
4.2 Number, sex and age groups of children aged 5-17 years and their distribution by region	36
4.3 Characteristics of children aged 5-17 years and their households	38
4.4 Housing types and living conditions of children aged 5-17	39
4.5 School attendance and reasons of school drop outs of children aged 5-17	40
4.6 Economic activity of children aged 5-17	43
4.7 Number, sex, age groups of working children and their distribution by region	45
4.8 Characteristics of working children and their households	47
4.9 Socio-economic characteristics of households of working children	47
4.10 Education level and school attendance of working children aged 6-17 years	50
4.11 Free time of working children	53
Chapter 5. Profile of working children	
5.1 Introduction	56
5.2 Economic activity of the children	56
5.2.1. Number of working children by current economic activities	57
5.2.2. Number of working children, by economic sector	58

5.2.3	Working children by employment status	60
5.2.4.	Working children by occupation	61
5.2.5	Working children by years worked	62
5.2.6	Monthly income of children engaged in paid employment	63
5.3.	Children engaged in non economic activities	64
Chapter 6. Child labour and causes and consequences of child labour		
6.1	Introduction	70
6.2	Child labour estimates	70
6.3	Non-school activities	73
6.4	School attendance of children engaged in economic activities	76
6.5	The reasons of being engaged in economic activities	78
6.5.1	The reasons to help households business, herding, production and services	78
6.5.2	The reasons for working outside of the household	80
6.6	Consequences of "if child does not working"	83
Chapter 7. Assessment of work place and work condition where children work		
7.1	Introduction	86
7.2	Location of workplace where children aged 5-17 years engaged in work	86
7.3	Assessment of workplace	87
7.4	Provision of labour safety uniforms, tools and instruments for children in work	89
Chapter 8. Children in hazardous work		
8.1	Introduction	92
8.2	Children in hazardous work	92
Chapter 9. Seasonal variations of child labour		
9.1	Introduction	96
9.2	Working children aged 5-17 years	96
9.2.1.	Working children aged 5-17 years, by economic sectors	98
9.2.2.	Working children aged 5-17 years, by employment status	98
9.2.3	Working children aged 5-17 years, by occupation	99
9.3	Free time of surveyed children aged 5-17 years	
Chapter 10. Comparative analysis of NCLS 2002-2003, 2006-2007, 2011-2012 findings		
10.1	Introduction	102
10.2	Economic activity of children aged 5-17 years	102
10.3	Working children	104
10.4	Child Labour	107

FOREWORD

One of the societal negative phenomena occurred during the transition to market economy is child labour. Mongolia has ratified UN Convention on Rights of Child in 1990, ILO Convention No 182 on Worst Forms of Child Labour in 2001 and the Convention No 138 on Minimum Age to Employment in 2002. As the country has ratified above conventions, Mongolia has been paying special attention to the development and implementation of national policy for eradication of the worst forms of child labour, including hazardous child labour. In connection with this, there is an increasing demand for accurate and reliable data and information on the scope, distribution and nature of child labour.

The National Statistical Office of Mongolia has conducted the Child Labour Survey (CLS) as a module of the Labor Force Survey (LFS) twice using the internationally accepted methodologies. As a result, the Child Labour Survey became a large scale national baseline survey which reflects seasonal variations in the labour market. These surveys also enabled the collection of a wide range of child work data in conformity with the ILO concepts and methodologies and creation of a database on child economic activities, the scope, nature and characteristics of child work. It is needed to augment the statistical information required to develop further strategies on child protection and assess the implementation of programmes and strategies, and to enrich the labour statistics system with child labour data. On the request of the ILO International Programme on the Elimination of Child Labour (IPEC), the National Statistical Office has conducted third Child Labour Survey with financial and technical support of ILO starting from July 2011, for one year.

The Third Child Labour Survey was important to collect comprehensive data on child labour, workplace condition and causes and consequences of child labour. It also enabled to initiate the assessment of the first phase of implementation of National Programme on Elimination of Worst Forms of Child Labour, which was approved in 2011.

We believe that the survey offers valuable data and information for defining children at risk or children engaged in labour. It assesses the national programmes and projects towards elimination of child labour and worst forms of child labour. It provides the basis for development and implementation of the national policy targeted for protection of the rights of working children and eradication of child labour, and creates the valuable baseline information for policy and decision making.

Using this opportunity, I would like to express our gratitude to Project Director of Global Action Program on Child Labour Issues at ILO Mr. Bijoy Raychaudhuri, officer Ms. N. Mongolmaa and national consultant Ms.B. Davaakhuu for their valuable support in conducting Third Child Labour Survey in line with internationally accepted methodologies under financial and technical support of IPEC-ILO.

Moreover, I would like to express our thanks and best wishes to the members of NSO Chairman's Council and Methodology Council for their professional advice and guidance and to the national and local survey teams for their effective cooperation in survey organization at national and local level, data collection and data processing.

S. MENDSAIKHAN

CHAIRMAN OF THE NATIONAL STATISTICAL OFFICE

I

CHAPTER

EXECUTIVE SUMMARY

1.1 OVERVIEW

The National Statistical Office (NSO) of Mongolia, with financial and technical support of the International Labour Organization's International Programme on the Elimination of Child Labour (ILO-IPEC) conducted a Child Labour Survey (CLS) as a module of the Labour Force Survey (LFS) 2011-2012 of Mongolia. The survey was previously conducted twice in 2002/2003 and 2006/2007 on a quarterly basis in compliance with the standard methodology, which reflected the seasonal variations in the labour market and became a large scale national survey of child labour. These surveys allowed for the collection of a wide range of data on child labour, child economic activity, characteristics and coverage of child labour, etc., and also the creation of a database for these indicators.

Mongolia ratified the UN Convention on Child Rights, in October 2002 the ILO Convention 138 on «Minimum age for labour» and in October 2000 the ILO Convention 182 on «Worst Forms of Child Labour.» Therefore, Mongolia has been paying special attention to the development and implementation of the national policy towards elimination of child labour and worst forms of child labour, and ending the involvement of children in harmful and hazardous work.

The international conventions recommend that "Every country which ratified the above conventions is obliged to eliminate child labour in their respective countries and develop national policy, which would set the minimum age for labour in compliance with the child's age when a child physiological as well as mental development would reach their full capacity.» Following these conventions, in 2008, the 18th Conference of International Labour Statisticians adopted a resolution on the statistics of child labour. The resolution noted the importance of eliminating the worst forms of child labour, and of determining the number of children involved in hazardous work, which reflects children involved in work which may have adverse effects on health, safety and moral development. As a response to the above resolution, the Government of Mongolia has adopted "The list of jobs and occupations prohibited for minors to be employed,» by the Order of Minister of Social Welfare and Labour (former) of Mongolia in 2008.

There is a rising demand for reliable statistics on the magnitude, distribution and characteristics of child labour. Based on previous research experiences to enrich child labour statistics, which will be required for development and implementation of child protection strategies and programmes the NSO conducted the third Mongolia National Child Labour Survey (CLS) as a module of the Mongolia Labour Force Survey (LFS) with financial and technical support of ILO-IPEC during from 1 July 2011 to 30 June 2012, for a total of one year.

In order to analyze child labour it is required to use three sets of key indicators that are related to children, household and society. These three sets of indicators used for previous surveys were improved and enriched using additional questions related to the socio-economic characteristics of households, school attendance, working children's characteristics and workplace conditions, health and safety hazards at the work[place, engagement in household chores. etc. The survey questionnaire was developed using "Statistical indicators measurement methodology of employment and labour force,» which was approved in 2009 for the purposes of estimating the main indicators of employment and labour force and compiling the labour force related annual reports and records. .

1.2 SURVEY OBJECTIVES AND RATIONALE

The main objectives of the survey are: to collect and analyze a wide range of information on the characteristics, nature, size and reasons for child labour, specifically, information on children engaged in hazardous and harmful work; to determine the workplace conditions and its impacts on education and normal development of working children; to provide required information for policy making; to compare the child labour status with other countries; and to enrich the database surveys.

The survey will provide inputs for assessing the changes that occurred in child economic activities and work conditions. In line with the ILO Convention 182 on "Elimination of the Worst Forms of Child Labour,» the Government of Mongolia has issued a resolution to intensify the activities towards eliminating the worst forms of child labour in all sectors of the economy. Therefore, the survey will be used as an instrument

for assessing the first phase of implementation of the “National Programme on Eliminating of the Worst Forms of Child Labour” which was approved in 2011 by the Government Resolution 303 targeted to 2016.

The importance of the survey can be defined as follows:

- The survey is conducted in compliance with the ILO standards and methodologies on a quarterly basis; therefore, it will enrich the database with information on child economic activities reflected in the seasonal variations in the labour market, child labour, child work magnitude, characteristics and nature.
- Monitor and assess child labour status at the national and local level, define child labour trends and the main reasons for child labour.
- Estimate indicators for implementation of the “National Programme on Elimination of Worst Forms of Child Labour”
- Create a database on basic information for prioritizing of the national interventions towards modification and improvement of the legal framework related to reducing the child labour, eliminating and prohibiting of the worst forms of child labour
- Modification of monitoring and evaluation indicators of child labour
- Enrich Mongolia’s child labour information and database, which would in turn contribute to expansion of the ILO child labour information and database.

1.3 SURVEY PERIOD

The survey covered four quarters, or one year from 1 July 2011 to 30 June 2012. It should be noted that the survey quarterly rounds are not the same as calendar records as in the previous two surveys. Accordingly, the first quarterly round extended from July to September 2011; the second quarterly round covered October to December 2011; the third quarterly round lasted from January to March of 2012; and the fourth quarterly round continued from April to June 2012.

1.4. REPORT CONTENT AND STRUCTURE

The current National Child Labour Survey report contains the following eleven chapters, namely:

- Chapter 1. Executive Summary
- Chapter 2. Survey methodology, organization, concepts and definitions
- Chapter 3. Demographic and household characteristics
- Chapter 4. Socio-economic characteristics of the working children and their households, and school attainment
- Chapter 5. Profile of working children
- Chapter 6. Child labour, its causes and consequences
- Chapter 7. Workplace and assessment of children’s working condition
- Chapter 8. Children in hazardous work
- Chapter 9. Seasonal variations in child labour
- Chapter 10. Comparative analysis of findings of the National Child Labour Surveys of 2002/03, 2007/08 and 2011/12
- Chapter 11. Sampling errors

Chapter 1 presents the executive summary of the report which contains the survey objectives and a summary of the main findings of the survey. Chapter 2 explains about the methodology, survey organization, and the concepts and definitions used for the survey. Chapter 3 describes information about demographic and household indicators. Chapter 4 presents socio-economic characteristics of working children and their households. Chapter 5 focuses on the information on characteristics of working children. Chapter 6 provides estimates of child labour using the concepts and definitions included in the resolution on "Child Labour Statistics" issued from ILO 18th International Conference of Labour Statisticians, and discusses the issues of reasons for work and causes and consequences of child work. Chapter 7 provides findings of work place assessments. Chapter 8 contains estimates of children in hazardous work. Chapter 9 captures seasonal variations in child labour. Chapter 10 compares the main findings of all the previous surveys such as 2002/03 CLS, 2006/07 CLS with the findings of the current 2011/12 CLS. And the last Chapter 11 provides insights into the survey sampling and its errors.

1.5 SUMMARY FINDINGS OF THE SURVEY

The findings of the NCLS show that children aged 5-17 years are estimated at 589,076, of which about 51 percent or 300,678 were boys; and 49.0 percent or 288,398 were girls. In terms of age groups, 34.2 percent of surveyed children were aged between 5 and 9 years, 15.6 percent were aged between 10 and 11 years; 24.5 percent were aged between 12 and 14 years, and 25.7 percent in 15-17 age groups. Of the estimated 589,076 children in the age-group 5-17 years, 93,968 children or 15.9 percent were engaged in economic activities during reference week.

Characteristics of children aged 5-17 years and their families

- Out of surveyed children aged 5-17 years, 54.5 percent were in the urban area and 45.5 percent were in the rural area.
- Out of surveyed children aged 5-17 years, 45.7 percent lived in gers, 33.8 percent lived in separate dwellings and 17.5 percent lived in the apartments.
- In terms of ownership types of the houses, 93.9 percent lived in own houses, 2.8 percent lived in others houses with no rent fee, 2.6 percent lived in others houses with rent fee, and 0.7 percent lived in houses with different ownership types.
- 97.9 percent lived in a household with electricity, of which 78.1 percent connected with central electric system.
- 16.5 percent of children were living in female headed household.
- 1.7 percent of surveyed children were disabled, of which 67 percent were disabled from birth, and 33 percent were with acquired disabilities.

School attendance and economic activity

- 88.3 percent or 519,900 children aged 5-17 years were in school during the reference week.
- Of the children in school during the reference week, 8.2 percent were studying in general education schools, 1.1 percent were studying in vocational or technical schools and 0.9 percent was studying in universities.
- Of the children in school during the reference week, 15.2 percent were economically active at the same time, 62.8 percent were engaged only in non-economic activities or performed household duties, and 22.0 percent only studied and were not involved in neither in economic activities nor performed household duties.
- 11.7 percent of children aged 5-17 years or 69,200 children were not attending school during the reference week, of which 26.1 percent performed household duties only. More than half of them were neither economically active nor helping household work. One fifth of nonschool children were engaged in economic activities.

- Out of surveyed children aged 5-17 years, 55,400 children were living outside of their households, of which 81.8 percent were in school, 6.6 percent were working and 12.0 percent were outside of their households due to other reasons.
- Nine out of ten rural children were outside of their households for study, while four out of ten urban children were outside of their households for reasons other than study and work. The other reasons should be studied in greater depth.

Reasons for being out of school

- The survey results showed that out of all children who are not attending school, 63.4 percent or 39,900 children were of preschool age (five years old).
- Nine percent of the remaining children were sick and disabled, 4.7 percent were children engaged in animal husbandry, 3.8 percent were not interested in schooling or had weak school performance, 2.8 percent were poor with no support for school supplies and clothes, 1.9 percent of the children were taken out of school by their parents and 1.7 percent were taken out by parents to help with household duties.

Number of working children and economic activities

- 15.9 percent of surveyed children or 93,968 children aged 5-17 years participated in economic activities, of which 54.1 percent were boys and 45.9 percent were girls.
- In terms of age groups, 16.8 percent of working children were aged between 5 and 9 years, 14.5 percent were aged between 10 and 11 years, 30.8 percent were aged between 12 and 14 years, and 35.9 percent were in 15-17 years age group.
- Out of ten working children, eight lived in rural areas and two lived in urban areas.
- Of working children, 0.9 percent was from female-headed households.
- One out of ten working children lived in households with monthly income of 140,000-200,000 togrogs, while four out of ten working children lived in households with monthly income of 200,000-400,000 togrogs.
- Of working children, 0.7 percent was earning household income alone.
- Of working children, 84.1 percent were in school; however, 15.9 percent were out of school.
- One-fifth of working children left school for to pursue herding.
- Regarding sector of economic activity, eight out of ten working children were engaged in agriculture, fishing, hunting and forestry, and one-tenth were involved in retail trading and auto-machinery maintenance and repair services. The remaining one-tenth children worked in other sectors. Generally, younger children tend to be engaged in agriculture, whole and retail trading, hotels, housing and restaurants related services. While children aged 15-17 years tended to be engaged in mining, quarrying, manufacturing, construction, entertaining, show and game services.
- Concerning employment status, more than six out of ten working children (66 percent) aged 5-17 years were engaged in animal husbandry, while three out of ten working children (30 percent) were unpaid family workers. Among others, 2.5 percent were self-employed, and 1.5 percent was in paid employment).
- In terms of occupation, 80.5 percent of working children were engaged as agriculture, forestry and fishing workers, 12.3 percent were workers in shop and market sales, 3.6 percent were occupied in manufacturing, construction, and arts related work, 2.9 percent were engaged in elementary occupations, and 0.7 percent worked as operators, machinery technicians, and assemblers.
- Nine out of ten rural working children were engaged in agriculture related works, while every second urban working child was engaged in trade and service related works.

Monthly income of working children with pay

- Two percent of working children worked for pay, of which 84.6 percent were boys and 15.4 percent were girls.
- Three out of ten working children with pay were in school, while the other seven were out of school.
- Every second working child with schooling earned a monthly income up to 50,000 togrogs a month. However, one-fourth of working children with no schooling earned income of 140,000-169,000 togrogs monthly.
- In terms of earned income, only boys earned a high monthly income, equivalent to more than 200,000 togrogs.

Children engaged in non-economic activities or in household duties

- Of children from 5-7 years, 70.9 percent or 417,700 were engaged in non-economic activities, mainly unpaid household services (also called household duties/ chores). It should be noted that a child can be engaged in a number of tasks falling within such household duties/ chores.
- A majority of children (75.8 percent) were engaged in cooking, cleaning of utensils, cleaning of ger and fences (68 percent), water fetching (53.7 percent), laundry services and ironing clothes (46.6 percent), firewood fetching (37.9 percent) and shopping for household needs (28.0 percent).
- In regard to age and sex distribution of children engaged in non-economic activities or household duties, some discrepancies were observed.
- A majority of girls were engaged in cooking, cleaning of utensils, cleaning ger and fences, and laundry services and ironing clothes, while boys were more likely to be involved in fetching water and firewood when compared to girls.
- In regard to household duties, six out of ten children aged 5-17 worked less than 10 hours per week, three out of ten worked for 10-25 hours per week, one out of ten worked for more than 25 hours weekly.

Child labour

Child labour is a narrower concept than children who are at work (working children), also termed as “the economically active children.» For this survey, the methodology on child labour estimates was developed and approved by the Joint Order of the Chairman of NSO and Minister of Social Welfare and Labour of Mongolia in 2009, in line with the recommendations of ILO Conventions No. 138 and 182¹. According to this methodology, child labour for statistical measurement purposes in Mongolia is defined as:

“Child labour” includes children aged 5-11 years engaged in economic activities; children aged 12-14 years in light work, but spend more than 14 hours a week; children aged 15-17 in work, but spend 43 or more hours a week.

- Out of 93,968 estimated working children aged 5-17 years, about 43,545 children (46.3 percent) were classified as child labour.
- In other words, 7.4 percent of all children aged 5-17 years (43,545 children out of 589,076 estimated population of the age group) were engaged in child labour.
- Of the child laborers, 60.2 percent or 26,210 were boys, and 39.8 percent or 17,335 were girls.

¹ Joint Order No. 01-68/94 dated 16 June 2009 and its Appendix dated 19 June 2009 (“Statistical indicators measurement methodology of employment and labour force”, Section 2.14. NSO and MSWL, 2009).

Number of working children or children engaged in economic activities outside of their households

- A total of 1,857 children aged 5-17 years worked or were engaged in economic activities outside of their households, of which 65.4 percent were in schooling and 34.6 percent were out of school.
- Eight out of ten working children outside of their households were boys, the other two were girls. A majority of them were children aged 15-17 years.
- Two-fifths of children working outside of their households responded that they were working to contribute to their household income. One-fifth was working outside of their household in self-interest.
- Urban and rural differences in reasons for work outside households have been observed. For rural children who worked outside of their household, the main reason for work was contributing to their household income (69 percent), while for urban children, the main reasons for work outside their household were self interest (32.9 percent) and desire to be economically independent (22.5 percent).
- In response to the question: "What would be the impact for you or for your household, if you could stop working outside your household", 48.6 percent of children responded that there would be no impact, 33.8 percent responded that their household living standard would worsen; 11.6 percent responded that they would have no household income, and 6 percent said it would affect adversely their work experience and practices.
- A total of 86.9 percent of children responded that they satisfied with their work place, 13.1 percent were unsatisfied with their workplace due to high levels of dust, humidity, underground and confined workspaces, lack of satisfactory hygiene, etc.
- Four out of ten children working outside their households said, they have safety uniforms, tools and instruments, while six out of ten said that they work with neither work uniforms, nor proper tools and instruments.

Children engaged in hazardous work

The survey presents the estimates of children engaged in hazardous work, which was defined based on the approved "The list of jobs and occupations prohibited for minors to be employed" and "Statistical indicators measurement methodology of employment and labour force"². Children engaged in hazardous work includes: (i) children aged 5-17 years who perform designated hazardous work; and (ii) children aged 5-17 years in work not designated as hazardous but at work for 43 or more hours in the reference week.

- Out of 93,968 working children aged 5-17 years, 11.1 percent or 10,398 children were engaged in hazardous work.
- Among the hazardous child labour, boys are 8,435 and girls are 1,963.
- Of the children engaged in hazardous work, 7.4 percent or 773 children aged 10-17 years were engaged in hazardous economic activities which are prohibited by the legal act "The list of work prohibited to involve children" approved in 2008 by the order of the Ministry of Social Welfare and Labour.
- A total of 10.8 percent (1,118) of hazardous child labour were engaged in harmful and hazardous work that is prohibited by the law. Of these children, 84.3 percent were aged 15-17 years.
- Nine out of ten children who engaged in harmful and hazardous work were boys.
- During the reference week, over 8,500 children were engaged in work or economic activities for 43 or more hours a week.

² (i) Joint Order of the Chairman of NSO Mongolia and Minister of Social Welfare and Labour of Mongolia No. 01-68/94 dated 16 June 2009; and (ii) Ministry of Social Welfare and Labour Order No. 107 dated 26 September 2009.

CHAPTER

**SURVEY METHODOLOGY,
ORGANIZATION, CONCEPTS AND
DEFINITIONS**

2.1 SURVEY COVERAGE

This survey was conducted simultaneously with the LFS using the same methodology and techniques as of the 2006/07 "Labour Force Survey and Supplementary Child labour Survey" (LFS+CLS). The sampling frame was drawn from total households of Mongolia taken from 2010 end year population and housing annual records and reports.

The survey was designed at the household level and covered children aged 5-17 years. Homeless children and children who live in prisons, orphanages, or special care facilities were not included in the survey.

2.2 SURVEY SAMPLING

The survey sampling unit was a household. The household is defined as a person or a group of people who usually live together and have common arrangements for food and shelter, such as using a common kitchen or a common food budget. Persons absent from the household for more than 6 months (military servants, students, those living abroad and prisoners) were excluded from the household membership count.

The same general techniques of the 2006/07 LFS+CLS were applied for the present CLS. In order to increase the probabilities of child labour coverage, sampling sub grouping was conducted. Sampling stratification of the current survey was done based on administrative units or all aimags and Ulaanbaatar City Districts. This enables determination of key labour statistics indicators by aimags and districts for policy makers. In the survey, 21 strata's were made on a single-grouping for each aimag, 8 strata's for 9 districts of Ulaanbaatar City (two districts with smallest number of households were combined), for a total of 29 strata's identified. *Khesegs* of khoroo and *bags* of aimags were selected as the first stage sampling units (FSUs). For the current survey, a total of 1,068 FSUs or 432 *khesegs* from Ulaanbaatar City and 636 *bags* from aimags were identified as FSUs (See Table 2.1). For the purposes of improving the sampling coverage and representativeness, as well as to limit potential sampling errors, 12 households were selected from each from FSU.

Table 2.1 First-stage sampling units and number of households selected from each sampling unit of Labour Force Survey

Strata number	Name of strata	Total population	Number of primary sampling units	Number of selected households		
				Total	In a Quarter	In a Month

2.3 SURVEY QUESTIONNAIRE, TRAINING FOR SENIOR INTERVIEWERS AND DATA COLLECTION

The previous 2006/07 LFS+CLS was conducted based on a questionnaire with 159 questions, which was divided into 7 topics. The current survey questionnaire was strengthened by 2 new sections and 24 questions, and consisted of a total of 9 sections and 183 questions. The new sections and updated questions were related to the collection of data on population education, specifically, reasons for school drop outs, data on children engaged in hazardous work and workplace conditions, etc. A new section of data on household members engaged in activities with no pay during the reference week was also included in the survey questionnaire.

Following the survey goals and objectives, as well as the scope and use of the concepts of current and usual economic activity, the questionnaire was designed to collect and analyze the following data:

1. Socio-economic characteristics of households (housing types, heating, ownership, energy sources, water supply, durable goods, private livestock, land, monthly average income, etc.)
2. Demographic characteristics (relation to a head of the household, gender, date of birth, any disability, if so, reasons of disabilities, marital status, etc.).
3. Indicators related to education and training (education level, school attendance, reasons of non schooling and school drop outs, literacy, profession, attendance of training for new skills and professions, if so by types of training).
4. Current economic activity or employment during the last week (economic activities, hours spent for work, economic activity and in-activity, primary and secondary occupation, economic sector, entity type, employment status, occupation classification, pay frequency from primary job, wages, earnings,

income, types of contract, whether the organization or employer provides subsidies, allowances and incentives, etc.).

5. Willingness of and opportunities for being engaged in additional work (willingness to perform additional work, available opportunities, if no opportunities, what are the main reasons and ways of seeking additional work, no interest in seeking additional work, etc.).
6. Unemployment (availability of jobs, reasons for being economically in-active, searching for a job during the last 30 days, methods of job search, job preference, expected wages and earnings [daily and monthly], registration with labour and welfare services, etc.).
7. Usual economic activity status (economic activity status during last 12 months or usual activity, primary and secondary employment engaged in during the last 12 month period, employment status, occupation, economic sectors, entity types, duration of being unemployed, methods of job search, earnings and wages earned from primary and secondary job engaged in during the last 12 month period).
8. Previous employment (previous employment, occupation, employment status, engaged in economic activity, entity types, duration of last job, reasons of leaving the last job, means of living during the unemployed period, etc.).
9. Unpaid services of household members (non-economic activity or activities engaged in during the reference week with no pay, hours spent for this work, etc.).
10. Work of children aged 5-17 years (child school attainment, reasons for school drop outs, whether to help with household business, if so, start age of being engaged in this work, reasons of becoming a helper, engaged in any work outside of household, if so, start age of being engaged in work outside of household, reasons for work outside of household, whether work is full time or part time, satisfaction with work place, reason for dissatisfaction of workplace, whether the work imposes physiological or psychological pressure, whether heavy or hazardous conditions are present at the work place, whether the child works at night or late hours, frequency of work, whether the child became ill because of his work, disease and injury types, who paid the cost of illness and injury treatment, for what the child spend his or her earnings, whether child has free time every day, etc.).

The minimum age for a household member to be surveyed was set at 5 years of age, in accordance with the internationally accepted standards. During the questionnaire design, comments of the Ministry of Social Welfare and Labour (former), National Center for Children, and ILO/IPEC were collected and integrated into the final draft of the questionnaire. The questionnaire was piloted in the field prior to its finalization. The survey questionnaire was approved by the Order No 01/84 of Chairman of NSO in 2011. The questionnaire is attached to this report.

The trainings for senior interviewers and interviewers were conducted twice. The first training was held during 15-16 June 2011. Since 2012, the NSO has introduced a new system of establishing survey teams in all aimags and in the capital, who have the responsibility to conduct data collection of sample surveys. In connection with the new system, the second training was conducted during 24-27 December 2011 for senior interviewers and interviewers. Although all senior interviewers of Labour Force Survey remained the same, most of the other interviewers were frequently changed. Therefore, from the beginning of the survey year, the NSO conducted close monitoring and provided instructions specifically for three aimags (Bulgan, Govi-Altai, Selenge) and Ulaanbaatar City.

During the data collection period, enumerators visited selected households and interviewed each eligible member who was over 5 years of age. In case of absence of household members during the interview period, enumerators needed to revisit the households 2-3 times to ensure full coverage of selected households. The supervisors frequently monitored whether all selected households participated in the survey. The monitoring and inspection team was established, and consisted of the survey lead team members and NSO management. The team frequently visited the survey field and provided necessary instructions and recommendations on proper and due implementation of the survey.

Survey data was collected during the pre-designed periods: the first quarterly round (July-September 2011), the second quarterly round (October-December 2011), the third quarterly round (January-March 2012), and the fourth quarterly round (April-June 2012).

2.4 DATA PROCESSING

Data processing of the survey was organized in two stages. The survey questionnaire, data entry, editing and validation, processing, and cross tabulations were conducted centrally at the NSO. Editing,

checking, coding of collected data, entry of the collected data into the computer and transmission of collected data to the central office was conducted by the LFS statistical team at the aimag and city statistical divisions.

Survey data entry, editing and validation, and consistency checks were conducted with the CPro3.1 package designed for censuses and surveys, while the actual data processing and production of final tables were conducted using the SPSS13.0 package. Upon completion of data processing, the survey team conducted the statistical analysis of selected indicators, the results were checked, and all discovered errors were corrected. The survey team then prepared summary tables of the findings to be used in the report.

2.5 CONCEPTS AND DEFINITIONS

This section explains certain concepts and definitions used in the survey that were developed in line with the "Statistical indicators measurement methodology of employment and labour force", which was approved in June 2009 by the Joint Order of the Chairman of NSO and Minister of Social Welfare and labour (former). These concepts are internationally accepted and include commonly used standards and definitions recommended by UN and ILO, which in turn enable the survey to be comparable with other NSO surveys as well as with similar studies conducted by other countries.

Child

A child is defined as an individual under the age of 18 years based on the ILO Convention on the Worst Forms of Child Labour, 1999 (No 182) and the UN Convention on the Rights of the Child. As it is commonly accepted that a child under 5 years of age is too young to be engaged in work or to start schooling, it therefore considers only children aged 5-17 years for the purpose of NCLS.

Age

Age is measured as the number of completed years at the child's last birthday. Year, month, day of birth is used for the estimation of completed years. Therefore, it is estimated backwards from the date of survey.

Age groups of children

Age groups of children for estimates used are 5-9, 10-11, 12-14 and 15-17. However, in accordance with the "Labour Law" of Mongolia, age groups of children for child labour estimates used are 5-14, 15 and 16-17.

Household

The household is defined as a person or a group of people who usually live together and have a common arrangement for food such as, using a common kitchen or a common food budget. These people may be related to each other or may be non-relatives, including domestic workers and other employees staying with the employer.

Head of household

The head of household is an adult member of the household who is accepted and recognized by other household members as a head. Where there is more than one household in a housing unit, each household should have its own head.

Survey year (reference year)

The survey year was defined based on the data collection period from July 2011 to June 2012.

Economic activity

Economic activity covers production and services for market and personal consumption. A system of national accounts covers all market production and certain types of non-market production, including production and processing of primary production for personal consumption, family business, personal account construction, and other production of fixed assets for personal use. Such activities may be paid or unpaid, and could occur within the formal or informal sectors. For example, people engaged in unpaid business activities of the household are considered as working in an economic activity.

Non-economic activity

Unpaid activities of a domestic nature, for example, caring for children and elders, house cleaning, cooking, etc., are considered as non-economic activities. These include:

- House cleaning, sewing and knitting clothing and other items
- Washing, laundering, ironing, maintaining dwellings and small repairs

- Preparing and serving meals for the household, cleaning utensils
- Caring for siblings
- Car for elders and sick persons
- Shopping for household consumption

Employed

Persons who are engaged in economic activity for pay (wages or salary) or profit, or as unpaid family worker in family business or farming, for at least one hour during the reference week and have an employment status.

Child labour

Child labour includes all children involved in economic activities for children between 5-11 years old, children between 12-14 years and engaged in light work for more than 14 hours a week, and children between 15-17 years old working for more than 43 hours a week.

Employment status

Status in employment refers to the status of an economically active person with respect to his or her employment, that is to say, the type of authority, duties and responsibilities related to their contact of employment with other persons or organizations within the person's place of work.

Paid employees

Refers to all person who furnish the supply of labour for production of goods and services for pay during the specified period under employment and services contract or under oral agreement or bilateral agreement with an employer, whose labour relations are regulated by the Labour Law of Mongolia, Civil Code and other related legal acts, who receives payment in cash or in kind as return to his provision of services or production for an employer.

Employer

A person or entity who work on their own account in their own business for the purpose of earning a profit, and who employ one or more persons to work for him/her with pay on a continuous basis under an employment contract or other agreements.

Self employed

Persons who work on their account and operate their own business independently or cooperating with others using their own equipment, tools and other materials for the purpose of earning profit, and who employ no other persons on a continuous basis (only on short term basis).

Member of producers' cooperative

Persons with in producers cooperative who contribute their own assets or labour for the act of cooperatively producing goods and services. Each member takes equal part in determining the organization of production, sales and/or other work for the establishment, including the investments and the distribution of the proceeds of the establishment amongst members.

Employed in animal husbandry

Persons who are employed in animal husbandry all around year, and get their means of subsistence from the income derived from animal or livestock products and raw materials.

Unpaid family workers

Family members who are living together or separately and engaged without pay in household economic activities, production and services (apart from animal husbandry) to meet their personal needs.

Persons not classifiable by status

Persons for whom insufficient relevant information is available, and/or who cannot be included in any of the preceding categories.

Children engaged in economic activities outside of their households

Children who work for pay and income outside of their households for more than one hour and children aged 5-17 years included in all above categories except those who work for their household's business with no pay.

Unemployed person

Refers to a working age person, who is available and capable of furnishing supply of labour for the production of goods and services and is not working, but actively seeking a job.

- a). "not employed" refers to persons who did not work for pay or under an employment contract, did not earn income from self-employed work or services during the reference week, as stated in the Labour Law or Claus 359 of the Civil Code.
- b). "available for work" refers to persons who were available for paid work and did not refuse to sign an employment contract or a work agreement as stipulated in the Labour law or Claus 359 of the Civil Code.
- c). "actively seeks work" refers to person who is actively looking for a job by registering with government or private employment offices, have received information about vacancies at least once, or applied at least once to a job vacancies provider or via internet pages, placing job seeking advertisements in posters and/or mass media.

Usual and reference period

In this survey, the "reference period" and "usual period" were used. "Reference period" refers to the last week of the survey period, and "usual period" refers to a 12 month period prior to the survey reference period.

Economically active population (labour force)

Economically active population comprises all persons available to furnish the supply of labour for the production of goods and services during a specified time-reference period, where goods and services are defined in accordance with the United Nations Systems of National Accounts (SNA). The economically active population (labour force) may be classified as "usually active" or "currently active" depending on the specified time-reference period. The economically active population (labour force) is the total of employed and unemployed persons.

Economically usually active population

Economically usually active population refers to the working age population who are unemployed or employed in economic activities during a long reference period or a 12 month period.

Economically currently active population

Economically currently active population comprises the working age population who are unemployed or employed by their primary activity for the reference week.

Economically inactive population

Economically inactive population comprises all the persons of working age who are not included in the economically active population and all the persons below and above the specified age. Economically inactive population also comprises the working age persons who retired early due to their working conditions and professional specifics, persons who partially or completely lost their work abilities for a period of 6 months or more, those of working age but full time attendants of educational institutions, those who do not work with valid or non valid reasons and the persons who have not yet reached working age. Economically inactive population (not in the labour force) is classified as "usually inactive" or "currently inactive" depending upon the specified time-reference period.

Economically usually inactive population

Economically usually inactive population refers to all persons who are not included in the economically active population (employed and unemployed) in terms of engagement in the primary economic activities in relation to a long reference period or 12 months. For example, full-time students, pupils, engaged in family duties, and retired persons.

Economically currently inactive population

Economically currently inactive population comprises all persons who are neither employed nor unemployed during the reference week due to the reasons of full time attendance in educational institutions; engagement in family duties; retirement or old age; or other reasons such as infirmity or disablement, which may be specified.

Economic sectors

Economic sectors are defined as the main types of production and services delivered by enterprises and entities and follow the International Standard Classification, "Classification of all types of economic activities."

Occupation

Occupation refers to the type of work, profession or trade performed by the individual during the reference period for pay (wages or salaries) and profit. If the person is unemployed, occupation refers to the kind of work that the person will be doing when they report for work.

Primary activity

Primary activity refers to the job the person devotes most of his working time to if that person has two or more jobs.

Primary occupation

If a person is engaged during the reference period (last week or last 12 months) in more than one job, either in wage or self-employment, the primary occupation is defined by social and legal aspects, wage and working hours of the employment. If a person is engaged in one specific job during the reference period, it is considered as the primary occupation.

Secondary occupation

If a person is engaged during the reference period (last week or last 12 months) in more than one job, either in wage or self-employment, the secondary occupation is defined by social and legal aspects, wage and working hours of the employment other than the primary occupation.

Earnings (wages and salaries)

Earnings relate to remuneration in cash and in kind for time worked, incentives, tea fee, and share from profit, pay for overtime, and pay from employers for food and housing, etc.

Literacy

Literacy is the ability to read and write (any language and dialect) with understanding a short, simple statement on his/her everyday life, and the maintenance of this ability for a certain time period. A person is considered illiterate if they are only able to read his/her own name, cannot read and write with understanding a short simple statement, or can read, but not write, and vice versa.

Student

A person engaged in studies as the main activity is considered to be a student. The person may be attending school or some other educational institution, or may be studying as an independent student.

The Worst Forms of Child Labour (WFCL)

- All forms of slavery or practices similar to slavery, such as sale and trafficking of children, debt bondage, and serfdom and forced or compulsory labour, including forced or compulsory recruitment of children for use in armed conflict;
- The use, procuring or offering of a child for prostitution, for the production of pornography or pornographic performance;
- The use, procuring or offering of a child for illicit activities, particularly for the production and trafficking of drugs as defined in the relevant international treaties; and
- Work which, by its nature or the circumstances in which it is carried out, is likely to harm the health, safety or morals of children.

Hazardous work

Hazardous work by children is any activity or occupation (hazardous sector and occupation) which, by its nature or type has, or leads to, adverse effects on the child's health, safety and moral development. Working for long hours and at night is considered to be hazardous work.

The list of jobs and occupations prohibited for minors to be employed

The list of jobs and occupations prohibited for minors to be employed was approved by Joint Order No 107 of the Minister of Social Welfare and Labour in 2008. The list consists of the following five main sections:

1. Jobs and occupations dangerous to children's health, life, morality, security and development
2. Jobs and occupations prohibited due to workplace conditions
3. Jobs and occupations prohibited due to industrial hazards
4. Other prohibited occupations
5. Jobs and occupations prohibited due to sectoral specialty

CHAPTER

DEMOGRAPHIC AND HOUSEHOLD
CHARACTERISTICS

3.1. INTRODUCTION

This chapter introduces the main findings from the LFS+CLS survey during the 4 rounds of quarterly data collection (started in July 2011 and completed in June 2012), which covered 1,068 sampling units and 12,816 sample households. According to the sample design, 12 households were selected from each unit, which resulted in 12,816 sample households. The survey coverage rate was 100.0 percent.

The current CLS is the third sample survey conducted in line with the ILO standard definitions, concepts and methodology. The NSO processed the data on a quarterly and annual basis. The report contains data and findings derived from the data from four quarterly rounds, and the tables that follow present summarized results.

3.2. DEMOGRAPHIC PROFILE

The 2011/12 LFS+CLS obtained information on main demographic characteristics such as population number, age and sex distribution, educational level, school attendance, the reasons for school dropouts, and the number of household members by urban and rural areas and by regions. Since the sample size was sufficient, the main output tables were produced by four regions, aimags and by the capital on a quarterly basis.

3.3. POPULATION SIZE, LOCATION BY REGIONS

The survey covers neither the individuals living in various institutions, nor people absent for 6 months or more. Table 3.1 presents the household members who were absent for 6 months or more by urban/rural locations and regions.

The number of household members who were away from home for 6 months or more consists of 7.6 percent of the total population (202,542 out of 2,666,550). Of these individuals, 30.4 percent belonged to the Khangai region, 23.6 percent to the Western region, 20.2 percent to the Central region, 7.0 percent to the Eastern region, and 18.8 percent belongs to the capital. Out of individuals who were away from their homes for 6 months or more, 64.0 percent or 129,652 persons were attending school or training, and 24.5 percent or 49,588 individuals left their home in search of employment

Table 3.1. Number of households of which members were absent for 6 months or more, by urban/rural location and region

Urban and rural/ region	Number of households	Number of household members	Number of persons outside households	Of whom:		
				Studying	Working	Other
Urban	51913	165251	81704	41329	26365	14010
Rural	67654	227228	120838	88323	23224	9292
Central	24445	77072	40974	28614	8375	3985
Eastern	8982	35467	14148	10563	2313	1272
Western	26816	102040	47725	34938	7848	4939
Khangai	36130	109575	61541	44252	13742	3547
Ulaanbaatar	23194	68325	38154	11285	17310	9559
Total	119567	392479	202542	129652	49588	23302

It should be noted that individuals located in institutions, such as military camps, prisons, school dormitories, hospitals and care facilities were not included in the surveyed population. Table 3.2 shows total households and population by urban/rural location and region. Approximately 59.3 percent of all households or 59.0 percent of the total population resided in urban settlements.

Table 3.2. Total households and population, by urban/rural location, region and gender

Location/Region	Households		Average household size	Population		
	Number	%		Total	Sex, %	
					Male	Female
Urban	418775	59.3	3.5	1454932	48.2	51.8
Rural	286843	40.7	3.5	1009076	50.4	49.6
Central	121036	17.2	3.3	404025	50.1	49.9
Eastern	55657	7.9	3.6	200211	48.8	51.2
Western	99431	14.1	4.0	400982	51.0	49.0
Khangai	158368	22.4	3.3	520416	48.7	51.3
Ulaanbaatar	271126	38.4	3.5	938374	48.2	51.8
Total	705618	100.0	3.5	2464008	49.1	50.9

Out of the total population, 38.1 percent belong to Ulaanbaatar City; 21.1 percent reside in the Khangai region; 16.4 percent live in the Central region, 16.3 percent in the Western region and 8.1 percent in the Eastern region.

3.4. POPULATION AGE AND SEX STRUCTURE

Figure 3.1 illustrates age structure of population based on Population and Housing Census and LFS's

Figure 3.1. Population age structure, by Population and Housing Census and Labour Force Surveys

Population age structure is based on the 2010 Population and Housing Census (PHC), LFS+CLS 2002/03, 2006/07 and 2011/12 series. According to the 2010 PHC, out of the total population, 69.0 percent are aged 15-64 years, and only 3.7 percent are persons aged 65 and above years. However, the LFS shows that out of the total population, 67.9 percent are aged 15-64 years, and 4.1 percent are persons aged 65 and above.

3.5. DEMOGRAPHIC DEPENDENCY

The demographic dependency ratio is estimated by dividing the sum of the population below the age of 15 and the population aged 65 and above to the total population between the ages of 15-64. For Mongolia, the demographic dependency ratio is 47.2 percent. From Table 3.3 on demographic dependency by urban/rural location and region, it is evident that the dependency ratio is lower in Ulaanbaatar City and urban settlements, is similar to the national average in the Khangai and Central regions, and is higher than the national average rural areas. The demographic dependency ratio is highest in Western region by almost eight percent, demonstrating that there are many people who are ineligible for work due to young age or old age in this region.

Table 3.3. Percentage demographic dependency, by urban/rural location and region

Demographic dependency	Total	Urban	Rural	Central	East	Western	Khangai	UB
Young aged (0-14)	41.2	38.2	45.7	42.3	44.1	50.9	41.0	36.4
Old age (65+)	6.0	6.2	5.7	6.7	6.3	4.2	6.0	6.3
National average	47.2	44.4	51.4	49.0	50.4	55.1	47.0	42.7

Similar to the previous section, the dependency ratio is quite low due to the exclusion of persons residing away from home for 6 months or more for educational and employment purposes.

3.6. HOUSEHOLD STRUCTURE

Table 3.4 shows the household size by urban/rural location and region. The household size is underestimated because the population number excludes people absent for 6 months or more. Out of total households, 10.4 percent are single-member units. However, 3.1 percent of the households are households with 7 or more members. These multiple-member households are dominant in the Western region and consist of 7.5 percent of total households within the region. Their average household size is 4.0.

Table 3.4. Percentage share of households, by size, urban/rural location and region

Household size	National total	Urban	Rural	Central	East	Western	Khangai	UB
1	10.4	10.5	10.2	11.5	9.7	6.7	11.1	11.0
2	17.1	16.6	18.0	19.0	14.5	12.8	20.2	16.7
3	23.7	24.8	22.2	24.5	22.8	18.9	25.2	24.5
4	24.9	25.7	23.7	24.0	25.0	24.5	24.7	25.6
5	14.4	13.5	15.8	14.2	19.6	18.3	12.5	13.2
6	6.4	5.7	6.9	4.9	5.7	11.3	4.7	5.8
7	1.9	1.9	2.1	1.3	1.6	4.7	1.1	1.8
8+	1.2	1.3	1.1	0.6	1.1	2.8	0.5	1.4
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Average household size excluding temporary absent members	3.5	3.5	3.5	3.3	3.6	4.0	3.3	3.5

3.7. FEMALE HEADED HOUSEHOLDS

The survey results demonstrate that 21.3 percent of the households are female headed, with 24.7 percent in the urban area and 16.4 percent in the rural areas. The percentage share of female-headed households to the total is shown in Table 3.5 by their size, rural and urban location. Usually, female-headed households are families with a few members. As the size of household increases, the share of households with a female head decreases. For instance, out of total single-member households, 46.8 percent are female headed and 54.3 percent for households with 2-3 members, then it decreases to 35.7 percent for households with 4-6 members and 31.7 percent for households with 7 or more members.

Table 3.5 Share of female-headed households, by size and urban/rural location

Household members	Female headed households		
	Total	Urban	Rural
1	46.8	46.0	48.1
2	33.9	39.2	26.8
3	20.4	24.7	13.4
4	11.6	14.2	7.5
5	11.0	13.6	7.8
6	13.1	18.7	6.3
7	13.0	19.7	4.2
8+	18.7	23.1	11.0
National average	21.3	24.7	16.4

3.8. EDUCATIONAL LEVEL

The survey collected information about the educational level, school attendance, the reasons for school drop outs and literacy among the population. The educational level of the population age 15 and above is shown in Table 3.8. Out of total population, 1.1 percent possessed a master's degree; 18.8 percent possessed a bachelor's degree; 6.4 percent possessed university or special technical education diploma; 6.7 percent were with primary vocational education; 31.6 percent were with complete secondary education; 22.0 percent were with partial secondary education; 7.0 percent were with primary education, and 6.4 percent were with no education. The data demonstrate that there is a broad similarity in educational attainments of females and males in both rural and urban areas, with marginally higher level of education, for instance, above university diploma and special technical education level, for females as compared to males. Table 3.6 shows that 7.5 percent of males and 5.5 percent of females have no education, 7.0 percent of males and 6.9 percent of females have primary education only. The respective percentages for rural area, 10.3 percent of females and 14.4 percent of males have no education; 11.3 percent of females and 11.7 percent of males have primary education only. In urban settlements, 24.6 percent of males and 29.5 percent of females possess bachelor or master's degrees, while for rural areas; this rate is 7.0 percent for males and 11.0 percent for females. Overall, the educational level is lower in rural areas compared to the urban settlements.

Table 3.6. Educational level of population aged 15, and above, by sex and urban/rural location, in percentages

Education level	Total			Urban		Rural	
	Total	Male	Female	Male	Female	Male	Female
No education	6.4	7.5	5.5	2.7	2.5	14.4	10.3
Primary	7.0	7.0	6.9	3.7	4.2	11.7	11.3
Incomplete secondary	22.0	23.9	20.2	16.0	13.5	35.4	30.7
Complete secondary	31.6	32.5	30.7	39.8	34.5	21.9	24.6
Primary vocational	6.7	7.0	6.4	7.5	6.9	6.3	5.6
Higher education with Diploma, vocational or professional middle	6.4	4.7	8.0	5.7	8.9	3.3	6.4
Higher/bachelor	18.8	16.4	21.1	23.1	27.5	6.8	10.8
Masters degree and above	1.1	0.9	1.3	1.5	2.0	0.2	0.2
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Population aged 15 and above	1774329	853347	920983	505041	564795	348306	356188

3.9 SCHOOL ATTENDANCE AND THE REASONS OF SCHOOL DROPOUTS

According to the survey results, out of the population aged 6-18 years, 96.0 percent attend school, of whom 94.6 percent are males and 97.4 percent are females. Table 3.7 shows that the late enrollment of children into school affects the overall enrollment level. In both urban and rural areas, school enrollment for girls is higher compared to the boys. In urban settlements, school attendance rate for both sexes was similar, though it changes from age 13 with male enrollment faltering in relation to that of female.

Table 3.7. School enrollment of children aged 6-18 years, by urban/rural location and gender

Complete age	National			Urban			Rural		
	Total	Male	Female	Total	Male	Female	Total	Male	Female
	%	%	%	%	%	%	%	%	%
6	81.6	78.3	85.0	83.4	80.4	86.4	79.3	75.6	83.1
7	98.2	98.7	97.5	98.8	98.6	98.9	97.4	98.8	95.7
8	98.9	97.7	100.0	99.2	98.4	100.0	98.4	97.1	100.0
9	99.1	98.8	99.3	99.8	100.0	99.6	98.2	97.3	98.9
10	99.2	98.6	100.0	99.3	98.7	100.0	99.1	98.4	100.0

18	94.5	93.1	96.1	98.3	98.6	98.0	88.9	85.8	92.9
School enrollment rate of children aged 6-18 years	96.0	94.6	97.4	97.7	97.1	98.3	94.0	91.8	96.4
Number of children enrolled in school	561015	282807	278209	155056	156604	311660	127750	121605	249355
Number of children aged 6-18 years	584169	297911	286258	160247	161752	321999	137664	124506	262169

Figure 3.2 School dropout, non-attendance and their reasons

The main reasons for school dropouts were various. For instance, 3.7 percent of children reported to be sick, 8.3 percent wanted to help in their household duties, 9.6 percent reported that parents decided not to send a child to school any longer, 10.0 percent reported that they performed weakly at school and were not interested in schooling, 10.5 percent were disabled; 23.5 percent were pre-school age, 24.8 percent wanted to help in animal husbandry, and 9.6 percent stated other reasons.

3.10 LITERACY

In this survey, literacy was defined as the ability to read and write with understanding a simple statement. A person is considered literate if he or she can both read and write a simple message. In contrast, if a person can only read own name or identify a simple figure, s/he is considered to be illiterate. The adult literacy rate is calculated as the ratio between persons who can read and write a simple statement to the population aged 15 and above. The 2010 Population and Housing Census of Mongolia estimated the adult literacy rate as 98.3 percent, and this survey identified literacy rate as the same.

Table 3.8 shows that in the rural area, the literacy rate is 97.4 percent, while in urban area; this rate is higher by 1.5 percentage points or 98.9 percent.

Table 3.8. Percentage adult literacy rate by urban/rural location, region and gender

Urban, rural / region	Total	Male	Female
Urban	98.9	99.0	98.8
Rural	97.4	97.5	97.4
Central	98.3	98.4	98.2
East	97.1	97.0	97.2
Western	97.2	97.6	96.7
Khangai	98.0	98.0	98.0
Ulaanbaatar	99.2	99.2	99.2
National total	98.3	98.4	98.2

Table 3.9 shows that the literacy rate among the male and female population below 64 years old is above 98 percent.

Table 3.9. Adult literacy rate, by age and gender distribution and urban/rural location, in percentages

Age groups	National total			Urban			Rural		
	Total	Male	Female	Total	Male	Female	Total	Male	Female
15 – 24	98.5	98.3	98.7	99.2	99.0	99.4	97.4	97.3	97.5

IV

CHAPTER

SOCIO-ECONOMIC CHARACTERISTICS OF WORKING CHILDREN, THEIR HOUSEHOLDS, AND SCHOOL ATTAINMENT

4.1 INTRODUCTION

The current NCLS aimed to analyze the participation of children aged 5-17 years in economic and non economic activities. This chapter analyzes the data on children aged 5-17 years, such as their age and sex distribution, urban and rural location, education level, school attendance, reasons for school drop outs, socio-economic characteristics and those of their households, availability of free time, etc.

4.2 NUMBER OF CHILDREN AGED 5-17 YEARS, THEIR AGE AND SEX DISTRIBUTION, LOCATION, BY REGION

The survey results demonstrate that out of a total of 2.6 million individuals in the country, 34.1 percent or 840,896 are children between 0-17 years. Of these children, 432,292 are boys, 408,604 are girls; the boys to girls sex ratio is 105.8, which is higher by 9.3 percentage points than that for the national population average of 96.5 male to female sex ratio. Out of children aged 0-17 years, 56.4 percent or 468,054 lived in urban settlements, and 44.3 percent or 372,842 lived in rural areas.

Table 4.1 Age and gender distribution of children, by urban/rural location and age groups

Age groups	Total			Urban			Rural		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

Moreover, the age distribution data show that out of children aged 0-17, 70.1 percent or 589,076 were of age 5-17, of which, 51.0 percent or 300,678 were boys, 49.0 percent or 288,398 were girls. Out of children aged 5-17 years, 54.5 percent or 320,897 lived in urban settlements, 45.5 percent or 268,179 lived in rural areas.

Table 4.2 Age and gender distribution of children aged 5-17 years, by urban/rural location, by percentages

15 – 17	25.7	25.1	26.3	25.9	25.2	26.5	25.5	25.0	25.9

The age groups' data shows that out of children aged 5-17 years, 34.3 percent or 201,840 were children of age group 5-9, 15.5 percent or 91,630 were children age group 10-11, 24.5 percent or 144,390 were children age group 12-14, 25.7 percent or 151,216 were children age group of 15-17, respectively (See Table 4.2).

The survey collected data on children aged 5-17 years who are living away from households for 6 months or more, and their reasons for living outside of the household. Out of total survey population of 589,076 children, 55,448 lived away from the household, which constitutes 9.4 percent.

Table 4.3 Number of children aged 5-17 years who are living away from their households and the reasons of their absence, by urban/rural location

Other	12.0	44.3	3.6
Total	100.0	100.0	100.0

Table 4.3 shows that the majority, or 79.3 percent, of children living away from their households for 6 months or more were residents of rural areas, and 91.6 percent left their families for educational purposes. The main reasons could be the lack of education institutions, isolation and quality of education in rural areas. The main reason of living away from home was similar for urban settlements, where 44.3 percent of children lived away from households for educational purposes. Out of urban children living away from the households, 11.4 percent were employed, while 44.3 percent were living away from home for other purposes. This indicator requires further in-depth analysis.

Out of surveyed children aged 5-17 years, 1.7 percent or approximately 9,900 were children with disabilities, of whom 56.4 percent were boys, and 43.6 percent were girls. Out of all children with disabilities, 67.0 percent were disabled from birth and 33.0 percent had acquired disabilities. Types of disability are shown in the below figure in accumulated numbers. One-third of children with disabilities were those with language, physical and mental disabilities.

Figure 4.1 Children aged 5-17 years with disabilities, by types of disabilities

4.3 CHARACTERISTICS OF CHILDREN AGED 5-17 YEARS AND THEIR HOUSEHOLDS

Out of surveyed children aged 5-17, 16.5 percent or approximately 97,300 children live in female-headed households. In the Eastern region and Ulaanbaatar City, this ratio was higher with a range of 0.8-7.5 percentage points. Overall, the female-headed households' ratio is quite different for urban and rural households (Figure 4.2). In urban settlements, one of every five households with children aged 5-17 years is headed by a female, while in rural areas; one of ten households is the female-headed unit.

Figure 4.2 Proportion of heads households, by sex and urban/rural location, in percentages

In terms of household distribution by its size, the majority, or 44.4 percent, lived in households with 3-4 members and 43.0 percent live in households with 5-6 members. This pattern remains similar for both urban and rural areas.

In Ulaanbaatar City and the Khangai region, out of children aged 5-17 years, 3.9/4.6 percent live in households with 1-3 members; 48.4/50.2 percent belong to households with 3-4 members; 4.8/5.9 percent live in households with 7-8 members, and 0.2/2.0 percent belong to households with 9 and more members, respectively. This shows that, the majority of the small size households are located in Ulaanbaatar City, and the Khangai region.

Table 4.4 Children aged 5-17 years, by household heads and household size, in percentages

Location, region	Total	Household head		Household size				
		Male headed	Female headed	< 3	3 - 4	5 - 6	7 - 8	9 +
Urban	100.0	79.4	20.6	4.2	49.4	38.0	6.6	1.8
Rural	100.0	88.3	11.7	2.5	38.4	49.0	8.6	1.5

Total	100.0	83.5	16.5	3.4	44.4	43.0	7.5	1.7

In the Western region, only 1.4 percent of children are living in smaller size households with 1-3 members, but 3.7 percent live in larger households with 9 or more members- the highest percentage when compare to the regions. One-tenth of female households with children aged 5-17 live in urban settlements.

Table 4.4.a Children aged 5-17 years, by household head and its size, urban/rural location and region, in percentages

Location, region	Total	Household head		Household size				
		Male headed	Female headed	< 3	3 - 4	5 - 6	7 - 8	9 +
Urban	54.5	51.8	67.8	66.2	60.6	48.1	48.1	59.1

Central	16.8	16.9	16.0	18.9	18.3	16.5	10.8	5.6
Eastern	8.5	8.4	8.8	5.0	8.2	9.7	5.2	6.4
Ulaanbaatar	31.9	29.5	44.1	42.8	36.1	27.7	24.8	38.9
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

A majority, or 42.8 percent, of households with children aged 5-17 and with less than 3 members reside in Ulaanbaatar City. A much smaller percentage (8.5 percent) of households with less than 3 members is found in the Western region. Of households with 9 or more members, more than half (46.6 percent) are located in the Western region.

4.4 TYPES AND CONDITION OF HOUSES WHERE CHILDREN 5-17 YEARS LIVE

Out of all children aged 5-17, 45.7 percent or approximately 268,900 lived in a ger; 33.8 percent or 199,200 lived in a single family house, and 17.5 percent or 102,900 lived in apartments. In terms of ownership of houses, 93.9 percent or 553,100 lived in own houses, 2.8 percent or 16,400 lived in other's houses with no rent fee, 2.6 percent or 15,400 lived in other's houses with rent fee, and 0.7 percent or 4,200 lived in houses owned by others.

Figure 4.3 Families with children aged 5-17 years, by type of dwelling

Figure 4.4 Families with children aged 5-17 years, by ownership of houses

The below figures show the living conditions and provision of electricity, water and sanitation facilities of families with children aged 5-17 years. Out of all children aged 5-17 years, 97.9 percent live in houses with electricity facilities, of which 78.1 percent are connected to the centralized system.

Figure 4.5 Families with children aged 5-17 years, by sources of electricity

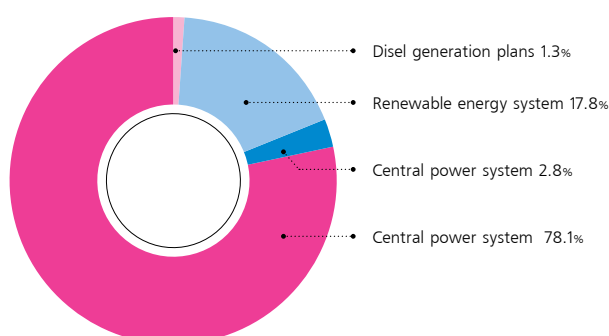

Figure 4.6 Families with children aged 5-17 years, by sources of water supply

In terms of households' water supply, 33.2 percent of the households had access to protected wells; 24.5 percent used water from rivers, lakes and unprotected wells and springs; and 13.9 percent had access to portable water sources. The key issue that deserves attention is the high percentage of households using water sources from lakes, rivers and unprotected wells and springs.

4.5 SCHOOL ATTENDANCE OF CHILDREN AGED 5-17 YEARS AND REASONS FOR SCHOOL DROPOUTS

This section explains the survey findings regarding school or training attendance of children aged 5-17 year during 2011-12 by type of educational institutions, grades, age group, and urban/rural location (Table 4.5, 4.5a and 4.5b).

Table 4.5 Number of children aged 5-17 years and their school attendance, by age groups and gender

Out of surveyed children aged 5-17 years, 11.7 percent did not study during the reference period (2011-12), of which a majority, were children aged 5-9 years. This is connected to the minimum age for school, which is age 6 in Mongolia.

Table 4.5.b Age structure of children aged 5-17 years, by school attendance and urban/rural location, in percentages

In terms of school attendance, more children did not enter any type of school or training institution in rural regions when compared to urban regions. For instance, 9.8 percent of urban children had not studied, compared to 14.1 percent of rural children. The breakdown by age group demonstrates that children aged 15-17 years who are not in school comprised 5.0 percent of the total children in urban areas and 15.9 percent in rural areas. This evidence highlights that there is an urgent need to focus on education for rural children in Mongolia.

Out of a total of 62,992 children who were not studying, 8.9 percent or approximately 6,100 were students who had graduated from schools. Therefore in Table 4.6, the distribution of the remaining 63,000 children is shown by various reasons for not studying. Out of these children, 58.3 percent or approximately 36,700 were boys, and 41.7 percent or approximately 26,300 were girls.

Table 4.6 Age-gender distribution of children aged 5-17 years, who are not attending school, by reasons

Age groups/ gender	total	Reasons for not studying												
		Pre-school age	Far from school	Unable to afford school supplies and uniforms	Unable to afford tuition fees	Poor performance and not interested in studying	Contribute to household income	migrated	Not enough space in dormitories	Help in household duties	herding	Demand and enforcement of parents	Sick and disabled	Other

The survey results showed that out of all children who are not attending school, 63.4 percent or 39,900 children were preschool age (5 years). The reasons for not attending school for children aged 6-17 are illustrated in Table 4.7.

Table 4.7 Number of children aged 6-17 years, who are not studying, by reasons and age groups.

Age groups	Total-child-ren aged 6-17	Reasons for not studying

The table shows a total of 23,069 children aged 6-17 years were not studying. Out of this total, 19 percent were children with disabilities, 11.3 percent of the children were assisting in livestock breeding, 10.1 percent poorly performed at school or not interested in studying, 5.3 percent could not afford the costs of school supplies and a school uniform, 7.9 percent left school on the demand and enforcement of parents, 4.8 percent were out of school to help in their household duties, 4.7 percent were sick, and 3.7 percent could not attend school due to long distance from their place of residence. It is important to note that one-fifth of all children in this age range did not attend school because of disability, marking a need for future programs and interventions for this group of children.

4.6 ECONOMIC ACTIVITY STATUS OF CHILDREN AGED 5-17 YEARS

The economic activity status of children of age group 5-17 is estimated as current (during the last week) and usual (during the last 12 months). To simplify understanding, the survey used the concept of current economic activity status. Thus, children were classified into categories such as; those engaged in economic activity (possibly also engaged in housekeeping activities); those engaged only in housekeeping activities (non-economic activity); those who only studied; and those being idle (including the sick and children with disability), attended schools or not attended schools.

Table 4.8 Number of children in school and not in school during the reference week, by economic activity status, gender and age groups

Out of all children, 11.7 percent did not study, about half of them, or 52.2 percent, did not engage in economic activities nor performed any housekeeping duties. Another 26.1 percent participated only in housekeeping duties. Overall, one-fifth of children who did not study were engaged in economic activities.

Table 4.9 shows, economically active children were dominant in rural areas. This fact is related to specific livestock herding activities in Mongolia. The majority of economically active children were those from households with a range of 3-6 members, and one-tenth of economically active children were those from female-headed households.

Table 4.9 Economic activity of children aged 5 -17 years, by household heads, size and urban/rural location

In terms of household size, 8.4 percent of children were from households with 1-2 members, 12.0 percent of children from households with 3-4 members, 19.4 percent of children from households with 5-6 members, 22.5 percent of children from households with 7-8 members, and 19.6 percent of children from households with 9 and more members, respectively, were engaged in economic activities.

4.7 WORKING CHILDREN BY AGE GROUPS, SEX, LOCATION AND REGION

Out of surveyed children of age 5-17 years, 15.9 or 93,968 children were considered as working children, of whom 54.1 percent or 50,870 were boys and 45.9 percent or 43,098 were girls.

Table 4.10 Number of working children by age group, sex and urban and rural location

Out of working-age children, 19.0 percent or 17,895 resided in urban settlements and 81.0 percent or 76,073 lived in rural areas. The age distribution of working children shows that 17,677 (18.8 percent) were of age of 5-9 years, 13,624 (14.5 percent) were of age 10-11 years, 28,945 (30.8 percent) were of age of 12-14, 33,722 (35.9 percent) were of age 15-17 years.

Figure 4.7 Age structure of working children aged 5-17 years, in percentages

In terms of sex distributions, the percentage of working girls aged 10-11 years to the total working children was higher by 2.1 percentage points when compared to boys of same age group. However, for other age groups, boys were dominant.

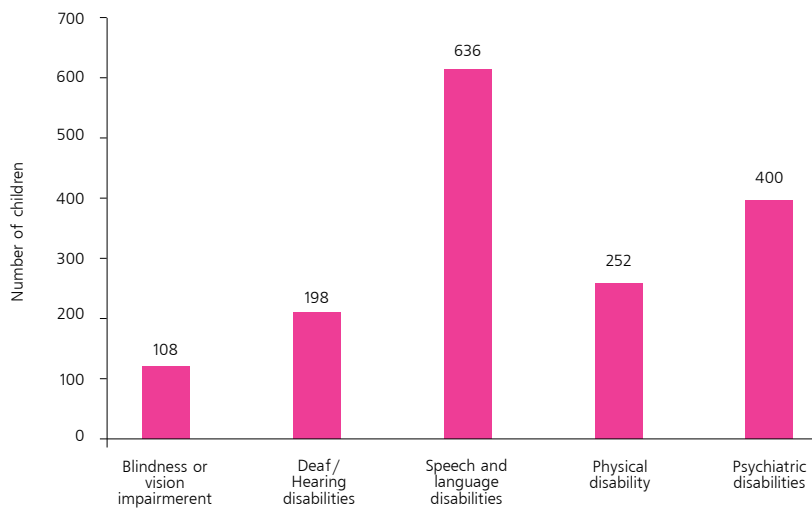

Out of total working children, 36,293 (38.6 percent) lived in Western region, 25,766 (27.4 percent) lived in Khangai region, 18,320 (19.5 percent) lived in Central region and 8,446 (9.0 percent) lived in Eastern region and 5,143 (5.5 percent) lived in Ulaanbaatar City.

Figure 4.8 Number of working children aged 5-17 years, by region

Out of working children aged 5-17 years, 1.3 percent or approximately 1,200 were children with disabilities. Of which, 67.0 percent were boys and 33.0 percent were girls. Of these disabled children, 63.4 percent had disabilities from birth, and 36.6 percent had acquired disabilities.

Figure 4.9 Working children aged 5-17 years, with disabilities, by type of disabilities

In regards to the economic sector, 92.0 percent of disabled working children were engaged in agriculture, hunting, forestry and fishing activities; 4.3 percent of disabled working children were engaged in manufacturing; and 3.6 percent were engaged in administrative and support service activities.

Figure 4.10 Working children aged 5-17 years with disabilities, by type of disabilities and economic sectors, in percentages

4.8. THE PROFILE OF WORKING CHILDREN AND THEIR HOUSEHOLDS

Working children belonged to 8.6 percent of total households across the country. Table 4.11 shows that 9.0 percent of working children or approximately 8,400 children were from female-headed households. Overall, the same pattern was observed for the Khangai, Eastern and Central regions. However, Ulaanbaatar City had the highest proportion of working children from female-headed households, or 17.4 percent, while the Western region demonstrated the lowest, at 6.3 percent.

Table 4.11. Working children aged 5-17 years, by gender of household head, household size, in percentages

Location, region and aimags	Households, by heads		Household size					Total
	Male headed	Female headed	< 3	3 - 4	5 - 6	7 - 8	9 +	
Urban	84.1	15.9	0.9	37.7	49.0	11.2	1.2	100.0

Total	91.0	9.0	1.8	33.3	52.2	10.6	2.1	100.0

A substantial difference was observed in the number of working children aged 5-17 in female-headed households between rural and urban areas. Approximately 2 out of 10 households were headed by female in urban settlements, while around one-tenth of households were female headed rural settlements. Figure 4.11 shows that a majority of working children belong to households with 5-6 members.

Figure 4.11 Working children, by household size and urban/rural location, in percentages

4.9 SOCIO-ECONOMIC PROFILE OF HOUSEHOLDS WITH WORKING CHILDREN

This section focuses on the socio-economic characteristics of households with working children, including housing types and conditions; home ownership and household average monthly income.

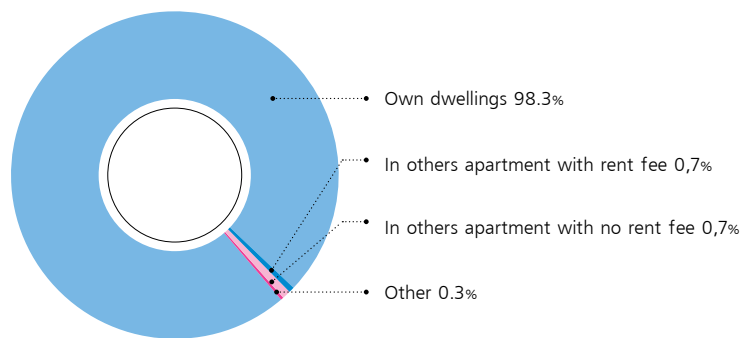

Figure 4.12 Households with working children, by type of dwelling, in percentages

*Convenient single family house: Designed for one household, connected to the central engineering lines and system or with independent engineering lines or connected to heating, air conditioning, water supply, sanitation, electricity supply, information communication lines.

**Single-family house: It mainly builds in ger districts of urban areas and rural local places, made up of one or more rooms with entire or partial infrastructure facilities including a kitchen, a bath, a shower, heating, water supply system and sanitary facilities.

Figure 4.13 Households with working children, by housing ownership, in percentages

In total, 70.5 percent of working children or approximately 66,200 lived in gers; 24.4 percent or approximately 22,900 lived in single family homes, 2.7 percent or approximately 2,500 live in apartments; 2.2 percent or approximately 2,100 lived in convenient single family homes.

In terms of housing ownership, 98.3 percent or approximately 92,400 lived in their own dwellings. Housing condition indicators, such as electricity and water facilities of households with working children aged 5-17 are shown in the figures below. A total of 35.8 percent of all working children aged 5-17 years lived in households were connected to centralized system.

Figure 4.14 Households with working children, by electricity sources, in percentages

Figure 4.15 Households with working children, by water sources, in percentages

More than one-third, or a total of 35.8 percent, of all working children aged 5-17 years lived in households that were connected to the centralized electricity system. In regards to household water sources, more than half, or 53.6 percent, of working children aged 5-17 years lived in households that drew their water from rivers, lakes and unprotected springs and other sources.

In terms of household average monthly income, a majority of working children aged 15-17 lived in households with income of 200,100-400,000 togrogs.

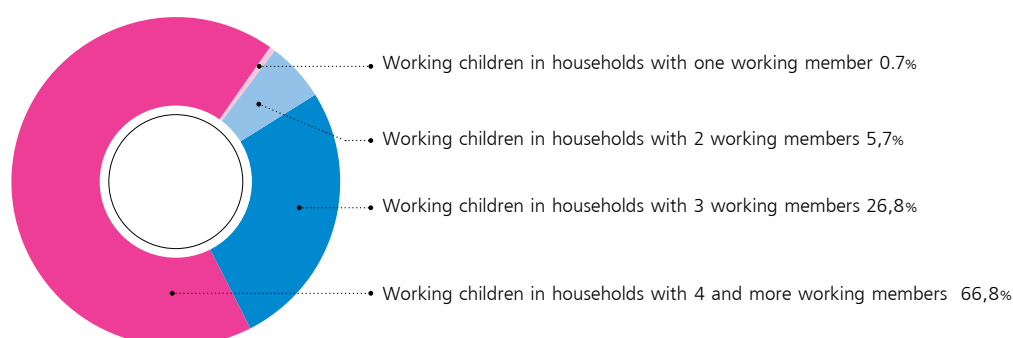

Out of all working children, 16.8 percent were living in households with monthly average income of 400,100-600,000 togrogs: 4.0 percent live in households with average monthly income of 140,100-200,000 togrogs: one-tenth of children live in households with 600,100-800,000 togrogs and 7.8 percent or 7,300 children live in households with a monthly average income of less than 140,000 togrogs.

Figure 4.16 Number of working children aged 5-17 by households' monthly income

The number of working persons per household, including working children, is shown in the figure below. About 66.8 percent of working children aged 5-17 years belong to households of which four or more members are working, while 26.8 percent belong to households with three working members, and 5.7 percent belong to households with two working members.

Figure 4.17 Number of working children aged 5-17, by working members in the same household, in percentages

Surprisingly, 0.7 percent or 628 children aged 5-17 years were working alone for his/her household. In terms of household size, 45.1 percent of these households contained up to 3 members; 34.5 percent contained 3-4 members, and 20.4 percent contained 5-6 members. In terms of the household head, six out of ten working children who are household income makers were from female-headed households, and the remaining four out of ten were from male headed households

4.10 EDUCATION AND SCHOOL ATTENDANCE OF WORKING CHILDREN AGED 6-17 YEARS

Out of all working children aged 5-17, 1.6 percent or 1,537 children were five years of age, below the age of schooling in Mongolia. Thus, the analysis of education and school attendance of working children provided concerns only school age children, or children age 6-17, the findings are presented in Table 4.12. Out of surveyed school aged, working children, 32.5 percent or 30,000 children did not have any level of education.

Table 4.12 Working children aged 6-17, by education level, gender and urban/rural location, in percentages

Out of all working children aged 6-17 years, 14.6 percent or 13,500 children were not studying during the reference period or the 2011/12 academic year, and out of these children, 27.6 percent were children aged 15-17 years. Out of working children aged 15-17 who were not studying during the reference period, 34.1 percent responded that they were assisting in livestock breeding.

In terms of school attendance, out of children not studying in any schools or training, 7.6 percent lived in urban settlements, while twice many, or 16.3 percent, lived in rural areas. Similarly, the percentage share of working children aged 15-17 years who were not studying was higher by 18.5 percentage points in rural areas than that in urban settlements.

Table 4.15 Working children aged 6-17 years, who are not studying, by reasons in percentages

Out of working children aged 6-17 years who were not studying, 28.3 percent or approximately 3,800 children had already graduated from school. Therefore, data concerning the remaining 9,700 children and their reasons for not studying is presented in Table 4.15. Approximately one-fourth of working children were engaged in livestock herding. Eight out of ten working children were boys, and the remaining were girls.

Figure 4.18 Working children aged 6-17 years who were not studying, by gender and reasons for not studying

In terms of reasons for not studying reported by working children aged 6-17 years, boys mainly noted: poor school performance, lack of interest in schooling, desire to contribute to household income, far distances to school, inability to afford the cost of school supplies and uniform, and lack of space in school dormitories. Moreover, boys were more likely to leave school to assist in livestock breeding and due to the demands of their parents when compared to the responses of their girl peers. However, there was no gender difference in reasons of helping in household duties and caring for sick, family members etc. Figure 4.19 demonstrates that of working children aged 6-17 who were not studying; boys were twice as likely to report disability as the main cause.

4.11 FREE TIME OF WORKING CHILDREN

Free time represents very important prerequisites for childhood development. For this reason, the survey collected data on the average hours per day a child of age 5-17 enjoys free time. It is not surprising that every surveyed child responded that they do enjoy free time. The majority, or 47.7 percent, (47,800 children) responded that they do enjoy at least 3-4 hours of free time per day.

Table 4.16 Free time of working children aged 5-17, in percentages in total

Age groups	Total	Average free hours a day			
		1-2	3-4	5-6	7-8
Total	100.0	19.0	47.7	24.3	9.0
5 - 9	100.0	8.5	38.0	37.3	16.2
10 - 11	100.0	13.4	46.3	29.7	10.6
12 - 14	100.0	15.1	51.7	25.2	8.0
15 - 17	100.0	30.3	49.8	14.4	5.5
Boys	100.0	19.8	46.3	24.0	9.9
5 - 9	100.0	9.0	41.6	32.1	17.3
10 - 11	100.0	14.9	43.6	30.3	11.2
12 - 14	100.0	15.5	49.2	25.5	9.8
15 - 17	100.0	30.7	47.3	16.2	5.8
Girls	100.0	18.2	49.2	24.6	8.0
5 - 9	100.0	7.7	33.7	43.6	15.0
10 - 11	100.0	12.1	48.9	29.1	9.9
12 - 14	100.0	14.7	54.6	24.8	5.9
15 - 17	100.0	29.8	52.9	12.1	5.2

Out of surveyed children, 24.3 percent enjoyed free time for 5-6 hours a day; 19.0 percent enjoyed 1-2 hours a day; and 9.0 percent enjoyed 7-8 hours a day as free time. There were not significant variations in terms of gender; however, age differentials were observed. As the age of the child increased, the hours for free-time decreased. Overall, the majority of all age groups on average enjoyed 3-6 hours a day as free time.

V
CHAPTER

PROFILE OF WORKING CHILDREN

5.1 INTRODUCTION

This chapter introduces the findings of a detailed study of the economic activities of children aged 5-17 years. The term “working child” represents a broad concept, and includes children who are engaged in work and labour activities. Self-employed children, children employed in family businesses, children engaged in paid and non-paid work, permanently and temporarily employed children, and children engaged in the formal and informal sectors are considered as economically active or employed. This also includes employed children who had a break from work during the reference week. Economic activity is an internationally accepted term for measurement of the labour force.

5.2 ECONOMIC ACTIVITIES OF THE CHILDREN

Livestock breeding is one of the most important economic activities for Mongolia and children from herding households are likely to participate in herding activities to assist parents, even at an early age. The high number of children who participate in herding activities can therefore be attributed to the economic importance of this activity. The following section discusses and analyses the status of working children who were active in economic activities during the reference period.

The survey findings show that out of surveyed children aged 5-17 years, 15.9 percent or 93,968 children were engaged in economic activities or working during the reference period.

Table 5.1 Number of working children aged 5-17 years, by age groups and gender

Age groups/gender	Total	Working children	Percentage share
Total	589 076	93 968	15.9
5-9	201 840	17 677	8.8
10-11	91 630	13 624	14.9
12-14	144 390	28 945	20.0
15-17	151 216	33 722	22.3
Male	300 678	50 870	16.9
5-9	102 275	9 648	9.4
10-11	48 057	6 667	13.9
12-14	74 821	15 986	21.4
15-17	75 525	18 569	24.6
Female	288 398	43 098	14.9
5-9	99 565	8 029	8.1
10-11	43 573	6 957	16.0
12-14	69 569	12 959	18.6
15-17	75 691	15 153	20.0

Table 5.1 demonstrates that of all children engaged in economic activities, 8.8 percent were between the ages of 5-9, 14.9 percent were between the ages of 10-11, 20.0 percent were between the ages of 12-14, and 22.3 percent were in the oldest age group, between the ages of 15-17.

Figure 5.1 Number of children engaged in economic activities, by age groups and gender

A comparative analysis of the Mongolia NCLS for 2006-07 and 2011-12 reveals that overall, the economic activity of children has increased, especially the share of children in the 10-17 age group.

5.2.1. Number of working children, by current economic activities

Based on economic activity and average hours spent in a primary occupation during the reference week, a total of 93,968 children were found to be currently active. Of these, 19.3 percent or 18,113 were not employed or not engaged in economic activity during the reference week despite having a work or a job. Therefore, this report focuses on the 75,855 children working or employed during last week.

Table 5.2 Number of currently working children aged 5-17 years, by employment status, hours worked during last week, age group and gender

Gender/ Age groups	Total children	Worked during reference week	Currently working children			Average hours spent on primary work during the last week.		
			Engaged in paid work	Self employed, and engaged in animal husbandry and unpaid family business	Engaged in both	Engaged in paid work	Self employed, and engaged in animal husbandry and unpaid family business	
Total children	589076	75855	1622	74181	52	41.7	20.7	
Male	300678	41906	1228	40626	52	42.9	23.8	
5-9	102275	7599	48	7,551	0	3.0	13.4	
10-11	48057	5231	56	5,175	0	21.0	17.2	
12-14	74821	13392	101	13,291	0	33.5	21.1	
15-17	75525	15684	1,023	14,609	52	46.9	34.1	
Female	288398	33949	394	33555	0	37.8	21.4	
5-9	99565	5879	66	5,813	0	10.0	12.2	
10-11	43573	5763	66	5,697	0	10.0	13.3	
12-14	69569	10017	0	10,017	0	0.0	16.6	
15-17	75691	12290	262	12028	0	51.9	21.4	

Table 5.2 shows that, out of 75,855 children who worked during the reference week, a total of 1,622 were involved in paid jobs, and the majority, or 74,181 children, were self-employed or were engaged in unpaid household businesses and duties. A total of 52 children were simultaneously engaged in both economic activities and household businesses. The age and gender distribution suggests that a higher number of boys are engaged in paid work when compared to girls, and that a majority of working children with pay were children in the age group 15-17.

Children in paid employment aged 15-17 years spent on average 46.9-51.9 hours per week at work, which is considered as child labour in accordance with the approved methodology¹ in Mongolia.

Current economic activity distribution of children by age groups, sex, employment, hours spent on work during the reference week, and urban/rural location are shown in Table 5.3. The majority of working children (79.0 percent) lived in rural areas. However, it is interesting to note that the majority of children in paid work lived in urban settlements. Out of all urban working children, 6.6 percent were employed in a paid job, while children employed in a paid job in rural areas constituted only 0.9 percent (568 children out of 59,956). A majority of working children in rural areas were self-employed, or engaged in animal husbandry, household business and services with no pay.

¹ "Methodology on measurement of employment and labour force statistical indicators", NSO and MSWL, 2009.

Table 5.3 Number of currently working children aged 5-17 years, by employment status, hours worked during last week, age group and location

5.2.2. Number of working children, by economic sector

This section provides analysis of data on working children by their age, sex distribution and economic sectors.

Figure 5.2 Working children, by economic sectors, in percentages

It is important to note that a majority, or eight out of ten children, were engaged in agricultural work. Out of all working children, 11.8 percent were engaged on whole and retail sales, and automobile/auto bike machinery repair and services; 3.0 percent worked in the manufacturing sector, 0.9 percent was involved in hotel, housing, and restaurant services, and 0.7 percent worked in the construction sector.

In terms of age structure in agricultural sectors, 21.5 percent of children were 5-9 years old, 15.1 percent were 10-11 years old, 30.7 percent were 12-14 years old, and 32.7 percent were 15-17 years old. Overall, younger age groups worked for agriculture; manufacturing; construction; whole and retail trading; automobile and auto bike reparation and services; hotel, housing, restaurants and catering services; information, communication and other services. However, children aged 15-17 years were more likely to be engaged in mining and quarrying; electric, gas, steam and air conditioning; professional, scientific and technological activities; cultural, entertainment, show, gaming services, etc.

5.2.3. Working children by employment status

Out of working children, 65.9 percent or 62,000 children were engaged in animal husbandry, 29.7 percent or 28,000 children were engaged in unpaid family businesses, 2.5 percent or 2,300 were engaged in self-employment. There was no significant difference in terms of sex distribution of employment status.

Figure 5.3 Working children, by employment status, in percentages

5.2.4. Working children, by occupation

The majority (80.5 percent or 75,600) of children were skilled agricultural and fishery workers, followed by shop and market sales workers (12.3 percent or 11,700 children), graft and related trades workers (3.6 percent or 3,300 children), elementary occupation (2.9 percent or 2,800 children) and plant and machine operators, assemblers and clerks (0.1-0.3 percent).

Table 5.5 Working children aged 5-17 years, by age groups, gender and occupation, in percentages

In terms of gender, occupational distribution was quite similar for both sexes; however, the main occupation for children of age 5-9 years was agriculture and service activities. Older children were mainly engaged in other occupations. Nine out of ten rural working children were engaged in agricultural works, while almost half of urban children were engaged in shop and market sales.

Figure 5.4 Working children, by occupation and urban/rural location, in percentages

5.2.5. Working children by duration of work experiences

Table 5.6 presents the estimates of working children of age 5 -17 years by duration of work experience, age group and sex. The data suggest that many children started their economic activities at relatively early ages. For instance, out of children aged 15-17 years, 4.2 percent have worked for more than ten years. The same pattern holds for both boys and girls.

Table 5.6 Number of working children, by duration of work, age groups and sex

One-tenth of working children aged 5-17 years have worked for five or more years, followed by two tenths of children who have worked for 3-4 years, and three tenths of children have worked for 1-2 years.

Figure 5.5 Working children, by duration of work, in percentages

5.2.6. Monthly income of children in paid employment

Only 2.0 percent of all working children were in paid jobs. The analysis of monthly income of these children is shown in the below Table 5.7.

Table 5.7. Number of working children aged 5-17 years engaged in paid jobs, by sex, their income and school attendance

Three out of ten working children engaged in paid work were in school, while the remaining majority of children in paid jobs were out of school. Every second child who did both work, and attended school earned an income of less than 50,000 togrogs a month, while one-fourth of children who do not attend school earned 14,000-169,000 togrogs a month. A substantial difference in regards to gender was not observed. However, only boys earned the highest monthly income, or income of 200,000 togrogs or more.

5.3. CHILDREN ENGAGED IN NON ECONOMIC ACTIVITIES

Out of surveyed children aged 5-17 years, 70.9 percent or 417,713 children were engaged in non-economic activities or in household duties. Tables 5.8 and 5.8a present the data on children engaged in non economic activities by their age groups and gender.

The current CLS included one additional type of household work task or non economic activity that is specific to Mongolia. That activity is the "moving, loading/unloading and making ger." The current survey findings showed that 1.4 percent of all surveyed children were engaged in this household activity.

Overall, the majority of children surveyed were engaged in non economic activities or household chores. It should be noted that children might be engaged in multiple household duties. Table 5.8a demonstrates that children were mainly engaged in cooking, cleaning utensils (75.8 percent), followed by ger and fence cleaning (68.0 percent), fetching water (53.7 percent), washing/laundrying/ironing (46.6 percent), collecting fuel/wood (37.9 percent), and shopping for household consumption (28.0 percent). Children's participation in non-economic activities or household chores was estimated by age group and gender. There were substantive gaps in terms of age groups and gender. Household chores such as cooking, cleaning of utensils and household, washing/laundrying/ironing was mainly done by girls.

In terms of hours spent for household duties per week, six out of ten children aged 5-17 years spent less than 10 hours; three out of ten spent 10-24 hours, and one tenth spent more than 25 hours a week. Substantial gender based differences were observed. For example, 10.8 percent of girls, compared to only 5.6 percent of boys spent more than 25 hours for household duties a week.

Table 5.8 Number of children currently engaged in household duties (non economic activities), by age groups, gender and type of non-activities

Age groups/ sex	Total number of children engaged in work	Type of household duties or non economic activities												
		Cooking, Serving food for household, cleaning utensils	Cleaning house and fence	Washing, laundrying and ironing	Minor household repairs	Shopping for households consumption	Knitting and sewing	Fetching water for drinking and washing	Fetching fuel and preparing firewood	Caring for elders and sick	Looking after child	Caring for pets for nonprofit purposes	Moving, loading and making ger	Voluntary/ community services with no pay

Table 5.9 shows that a substantial number of children aged 5-9 were engaged in household duties. However, 81.4 percent of these children spent less than nine hours for household duties per week. It was observed that as age of children increases, the hours per week spent on household duties increases. For instance, three out of ten children aged 10-11 years compared to four out of ten children aged 12-14 years spent 10-42 hours for household duties a week.

The number of girls (3,628) who spent more than 43 hours a week for household chores were substantially higher than boys (1389). The above table shows that children aged 10-14 and 15-17 years have spent numerous hours contributing to household chores. Water and fuel fetching is mainly performed by boys. However, in household shopping tasks, both boys and girls participate. For activities such as minor household repairs, knitting, and sewing, older children are preferred.

VI

CHAPTER

CHILD LABOUR, AND CAUSES AND CONSEQUENCES OF CHILD LABOUR

6.1 INTRODUCTION

Mongolia is a country with a young population. In fact, almost half of its population is under that age of 24. For this reason, the Government of Mongolia has been taken many important measures to maintain the well-being of its population and to protect their rights. However, many challenges related to the violation of children's rights still exist, including violence to children, poverty and malnutrition, lack of shelter, and child labour. These circumstances result in negative consequences for Mongolia's children, such as detriments in health and well-being as well as in education. Therefore, there is an urgent need to assess these survey results in order to understand the factors that compel children to seek work and the dangers that result from such work.

Using the findings of the previous sections, the magnitude of child work and of child labour is analyzed in this chapter. In addition, causes and consequences of children's engagement in economic and non-economic activities are analyzed, including children's own view on the consequences that would occur if they stopped working.

6.2 CHILD LABOUR ESTIMATES

Child labour is a narrower concept than children who are at work that is "the economically active children". For this survey, the methodology on child labour estimates was developed and approved by the Joint Order of the Chairman of NSO and Minister of Social Welfare and Labour of Mongolia in 2009¹, in line with the recommendations of ILO Conventions No. 138 and 182. According to this methodology, child labour for statistical measurement purposes is defined as follows:

"Child labour" includes children aged 5-11 years engaged in economic activities; children aged 12-14 years in light work, but spend more than 14 hours a week; children aged 15-17 in work, but spend 43 or more hours a week. ("Statistical indicators measurement methodology of employment and labour force", Section 2.14. NSO and MSWL, 2009).

For the estimate of child labour in Mongolia, this procedure has been followed as the official approved methodology (Table 6.1).

In this chapter, an alternate estimate is also made of 'long hours of work' by children according to the Labour Law (Table 6.2). It should be noted that the results of the two estimates are obviously different, due to variations in the criteria of, both, hours spent at work during the reference week, and the child age groups thresholds. This alternate estimate is provided for use by policy makers, and to highlight that a sizeable proportion of working children, who fall technically outside the official child labour count criteria, are in a vulnerable situation.

Child labour estimate according to the approved official methodology: Child labour estimate made according to the approved methodology based on hours spent in economic activities during the reference week by children's age groups is shown in Table 6.1.

¹ Joint Order No. 01-68/94 dated 16 June 2009 and its Appendix dated 19 June 2009.

Table 6.1. Child labour estimates based on hours spent in economic activity, by age group and gender (according to the approved methodology)

Hours spent in a week/gender	Total	Age groups

Of which: child labour	1 115		60	1,055
Of which: child labour	17 167	11 644	4 080	1 443

The shaded area of Table 6.1 indicates that out of 75,855 children engaged in economic activities during the reference week, 54.9 percent or 41,654 children were in child labour. This survey report has estimated total child labour as consisting of (i) child labour estimate based on long hours at work (43 hours and more) spent in the reference week, and (ii) estimates of children in hazardous activity and in hazardous work conditions². The estimate of children in hazardous work, which was defined based on the officially approved "List of jobs and occupations prohibited for minors to be employed"³ is provided in Chapter 8.

² Since the estimate of (ii) is rather small and its statistical classification by ISIC and ISCO codes is not as yet robust, the possible overlap of a few child labour belonging to both (i) and (ii) has not been attempted.

³ Ministry of Social Welfare and Labour Order No. 107 dated 26 September 2008.

The overall survey finding is that of 93,968 working children aged 5-17 years, 46.3 percent or 43,545 (41,654 + 1,891) children were engaged in child labour. In other words, 7.4 percent of all children aged 5-17 (43,545 children of 589,076 estimated child populations in this age group) were engaged in child labour. Of these children, 60.2 percent or 26,210 (24,487+1,723) were boys and 39.8 percent or 17,335 (17,167+168) were girls.

Estimate of 'long hours of work' by children according to the Labour Code of Mongolia: The Labour Law of Mongolia states, among others, that⁴:

- A citizen who has reached the age of 15 years old is eligible to make an employment contract with consent of his or her parents or guardians.
- It is permitted for a 15 year-old child to work up to 30 hours per week, and up to 36 hours per week for a child aged 16-17 years.

Table 6.2. Estimates based on long hours spent by children in economic activity, by age group and sex (according to the Labour Law)

Hours spent in a week/gender	Total	Age groups		
		5-14	15	16-17
Number of working children	75 855	47 883	8 597	19 375
Less than 29 hours	58 015	41 345	5 929	10 741
30-35 hours	4 577	2 372	621	1 584
36 and more hours	13 263	4 166	2 047	7 050
Of which: child labour	57 601	47 883	2 668	7 050
Male	41 905	26 223	4757	10926
Less than 29 hours	29 276	21 664	2 737	4 875
30-35 hours	2 673	1 631	281	761
36 and more hours	9 957	2 928	1 739	5 290
Of which: child labour	33 533	26 223	2 020	5 290
Female	33 950	21 661	3 840	8 449
Less than 29 hours	28 739	19 681	3 192	5 866
30-35 hours	1 904	741	340	823
36 and more hours	3 306	1 238	308	1 760
Of which: child labour	24 068	21 660	648	1 760

The alternate estimate of 'long hours of work' by children based on the above criteria is shown in Table 6.2. According to the survey findings, and by the criteria of the Labour Code of Mongolia, there were 57,601 (Table 6.2) children engaged work in excess of the permitted weekly work hours. This number constitutes 75.9 percent of all children engaged in economic activities during the reference week. Of these children, 58.2 percent were boys and 41.8 percent were girls. This ratio was similar to previous estimates. Of children so engaged in work hours not permissible under the Labour Code, 83.1 percent were children aged 5-14 years, 4.6 percent were children of age 15, and 12.2 percent were children aged 16-17 years.

This estimate shows a higher percentage of children in excessive weekly work hours labour as compared to the estimate (by the official statistical measurement of child labour) and is due to two main factors. First, there is no 'light work' exemption provision for the child age group 12-14 years; and second, a lower cut-off threshold on weekly work hours for children aged 15 and over is applied.

This suggests that the existing official statistical estimation methodology of child labour should be improved in line with the recommendations issued by the resolution on "Child Labour Statistics" of ILO 18th Conference of Labour Statisticians and the Clauses of Labour Code of Mongolia.

⁴ The Labour Law of Mongolia 2008, Articles 71.1, 109.2 and 109.3

It may also be noted that as the current survey excluded street children and children living in institutions, and therefore, the results presented in this report are an underestimation the prevailing child labour situation in Mongolia. Moreover, as the survey conducted was based on children living in households, it has not been able to estimate fully children engaged in the worst forms of child labour other than those undertaking hazardous work.

6.3 NON-SCHOOL ACTIVITIES

During the reference week, out of 589,076 surveyed children aged 5-17 years, 93,968 or 16.0 percent were engaged in economic activities; 344,680 children or 58.5 percent were performed household duties only; 114,300 children or 19.4 percent studied only, and 6.1 percent were neither studied nor worked. Table 6.3 presents data on activities performed by children during the reference week by age groups and gender.

There was no substantive gender difference for children who only studied and for children who neither studied nor worked among children aged 5-17 years. However, 16.9 percent of boys and 14.9 percent of girls were engaged in economic activities, while 56.9 percent of boys and 60.2 percent of girls performed household duties. This indicates that boys have more opportunities to earn income when compared to girls. The data further indicated that as age rises, the number of children that only study decreases, and the number of children (boys and girls) that engaged in economic and in non-economic activities, both with or without other activities, tends to increase.

Table 6.3. Activities performed by children aged 5-17 years during the reference week, by age groups and gender

		Total	Economic activity (with or without other activities)	Household duties (with or without other activities)	Studied only	None of them

	Total	100.0	14.9	60.2	19.1	5.8

In terms of location, the majority of urban children, or 68.8 percent, was engaged in household duties only. This figure was less by 22.6 percentage points for rural children. Opposing, the percentage of rural children engaged in economic activities was higher (28.4 percent for rural children), compared to only 5.6 percent for urban children. Those responding: "only studied" and "idle" were similar for both urban and rural children.

Figure 6.1. Activities performed by children aged 5-17 years during the reference week, by urban/rural location, in percentages

Out of all children aged 5-17 years, 11.7 percent or 6,915 children were out of school. Economic activity of these children during the reference week is presented in Table 6.4. The age distribution demonstrates that out of all children who were not in school, 71.6 percent or 49,539 children were of the 5-9 age groups, followed by 6.7 percent or 4,641 children of the 10-14 age group and 21.7 percent or 14,973 children of the 15-17 age groups. It is important to highlight that out of all children of aged 7-17 (N= 21270) who are entitled to schooling, 30.8 percent were not actually in school.

Out of children who were not in school but engaged in economic activities, 19.0 percent belonged to the 5-9 age groups, which was higher by only 0.1 percent than children of the 10-14 age groups. It is notable improvement that the ratio of young children who engaged in economic activities decreased substantially, which was twice as high as compared to the 10-14 age groups in the previous 2006/07 survey.

Table 6.4. Activities performed by children who are not studying, during the reference week, by age groups and gender

		15.4	59.9	23.3	2.4

Table 6.4 indicates that a majority of children aged 5-9(72.0 percent) perform household chores. Out of children who were not in school but engaged in economic activities, 77.5 percent were boys and 22.5 percent were girls.

Figure 6.2. Activities performed by children who are not in school during the reference week, by urban/rural location, in percentages

In terms of location, economic activities of children who were not in school were similar for both urban and rural areas. Out of children engaged in economic activities, 90.9 percent were rural children. This indicated that there is a high probability for rural children to be out of school for purposes of work.

6.4 SCHOOL ATTENDANCE OF CHILDREN ENGAGED IN ECONOMIC ACTIVITIES

The survey results show that out of surveyed children aged 5-17 years, 15.1 percent or 89,142 were engaged in livestock breeding, manufacturing and services. Of these children, 53.6 percent or 47,805 children were boys and 46.4 percent or 41,337 were girls. Table 6.5 provides data on children performing household duties and their school attendance by age groups, gender and urban/rural location. In total, 85.4 percent of children engaged in household duties were in school. In terms of location, 94.8 percent of urban children and 83.3 percent of rural children were engaged in household duties in addition to their schooling.

Table 6.5. Children performing household duties, by age groups of starting to help, school attendance, urban/rural location and gender

		Total	School attendance		
			Total	Yes	No
Total		89 142	100.0	85.4	14.6

15-17		24 002	100.0	69.3	30.7
Gender					
Boys		47 805	100.0	78.8	21.2
Girls		41 337	100.0	93.0	7.0

Out of children engaged in household duties, 18.9 percent belonged to the 5-9 age group followed by 46.1 percent in the 10-14 age group and 35.0 percent in the 15-17 age group. The urban and rural distribution suggests that the majority of urban children aged 15-17 assist their households, while the majority of rural children aged 10-14 assist their households. The data further more indicates that participation of rural children in their household chores is four times higher than that of urban children. Figure 6.3 illustrates school attendance of children performing household duties.

Figure 6.3. School attendance of children performed household duties, by age groups, percentage share

Survey findings show that out of surveyed children aged 5-17 years, 1,857 children were engaged in economic activities outside of their household. Of these children, 83.7 percent were boys and 16.3 percent were girls. Table 6.6 demonstrates the school attendance of children engaged in work outside of the households, by their age groups and urban/rural location.

Table 6.6. School attendance of children engaged in work outside of households, by age groups and urban/rural location

	15-17	623	330	293	53.0	47.0

Of the children engaged in work outside of the household, 2.6 percent belonged to the 5-9 age group; 3.0 percent were children in the 10-11 age groups; 11.8 percent were children in the 12-14 age group, and 82.6 percent were children in the 15-17 age group. In terms of location, the majority of children engaged in work outside of the household belonged to age group of 15-17 years. There were no children aged 5-9 years who engaged in outside of household in the rural area. All 48 children engaged in work outside of the household resided in urban settlements.

As stated earlier, out of children engaged in work outside of the household, 2.6 percent (48 children out of 1,857) children of age 10 and below. This figure decreased by 15.9 percent as compared to the previous 2006/07 CLS.

Figure 6.4. Number of children engaged in work outside of the households, by school attendance, urban/rural location and gender

The proportion of urban children in school and engaged in work outside of the household was 3.7 percent higher than for rural children. The above figure shows all girls engaged in work outside of the household. Six out of ten boys who engaged in work outside of the household were attending school.

6.5 THE REASONS FOR ENGAGING IN ECONOMIC ACTIVITIES

6.5.1 Reasons for helping in household business

This section presents the analysis of the reasons reported by children or helping in household business. The survey results revealed that, out of total surveyed children aged 5-17 years, 15.1 percent helped in their household business, livestock breeding, and household production and services.

Table 6.7. Reasons of children's engagement in household activities, by age groups and gender

The reasons for helping in household business are illustrated in Table 6.7 by children age groups and gender. The below table and figure show that majority or nine out of ten children responded that they engaged in household business, production, services and livestock breeding activities to help their parents. A negligible number of children (0.5 percent) responded that they started work under "parents' request". Of these children nine out of ten children were in urban areas.

There was no major difference observed by gender and location.

Figure 6.5. Distribution of children by reasons for engaging in household activities, in percentage

Survey results demonstrate that children in school were engaged in household production, services and livestock breeding to gain work experiences and to help parents.

Figure 6.6. Distribution of children engaged in household activities, by reasons and school attendance

Figure 6.6 highlights that a majority of children engaged in household activities to help parents. This reason was cited by 89.0 percent of children attending schools and 76.1 percent of children not attending schools. The reason, "Shortage of labour force in household business," was cited by 6.7 percent of children attending school and 17.9 percent of children not attending school.

Responses provided by children not in school about the reasons of shortage of the labor force in household business and parents requests were higher than that of children in school. A majority of children, or 93.5 percent, who engaged in household business but were not attending school were in rural areas.

6.5.2 Reasons for working outside of the household

Table 6.8 describes reasons for children’s engagement in work outside of the household by age groups and gender, and the percentage distribution of children by reasons for engaging in work outside of the household is shown in Figure 6.7. This figure demonstrates that the highest number of children, or 38.1 percent started economic activity to contribute to their household income. This response was given by 37.1 percent (451 children out of 1,215) of children in school, and 39.9 percent (256 children out of 642) of children not in school.

Figure 6.7. Percentage distribution of children by reasons for engaging in work outside of the household

In total, 20.2 percent of children (375 out of 1,857) responded that they “wanted to engage in work outside of the household.” This included 26.6 percent (323 out of 1,215) of children in school and 8.1 percent (52 out of 642) of children not in school. The reason of self-support and economic independence was cited by 15.1 percent of all children: 9.7 percent (118 out of 1,215) of children in school, 25.4 percent (163 out of 642) of children not in school. Some children engaged in work outside of the household due to their desire to gain work experience (5.6 percent) and to cover the cost of schooling (14.8 percent).

Table 6.8. Reasons of engaging in work outside of the household, by age groups and gender

Age groups/gender	Total	Gain experience and skills	Contribute to the household income	Self-support/ economic independence	Cover cost of schooling	Child wanted	Other
Total	1 857	104	707	281	275	375	115
5 - 9	48					48	
10 - 11	56				56		
12 - 14	220		127		66	27	
15 - 17	1 533	104	580	281	153	300	115
Total	1 554	104	567	163	275	330	115
Boys							
5 - 9	48	0	0	0	0	48	0
10 - 11	56	0	0	0	56	0	0
12 - 14	181	0	88	0	66	27	0
15 - 17	1 269	104	479	163	153	255	115
Total	303		140	118		45	
Girls							
12 - 14	39	0	39	0	0	0	0
15 - 17	264	0	101	118	0	45	0

Figure 6.8 illustrates that reasons for engaging in work differ by gender. For instance, 24.4 percent of boys responded that, the main reason was gaining work experiences and earning to cover the cost of schooling, while no girl cited these reasons. Girls cited their desire to contribute to household income, self-support or economic independence and self wanted as their main reasons for work outside of households.

Figure 6.8. Distribution of children by reasons for engaging in work outside of the household, by gender, in percentages

A total of 36.5 percent of boys engaged in work outside of the household and 46.2 percent of girls engaged in work outside of the household responded that self-support and economic independence was their main reason for engaging in work. Additionally, 21.2 percent of boys responded that their main reason for working outside of their home was “self wanted,” which was higher by 6.3 percent when compared to their girl peers who cited the same reason.

Figure 6.9. Distribution of children by reasons for engaging in work outside of the household, by urban/rural location, in percentages

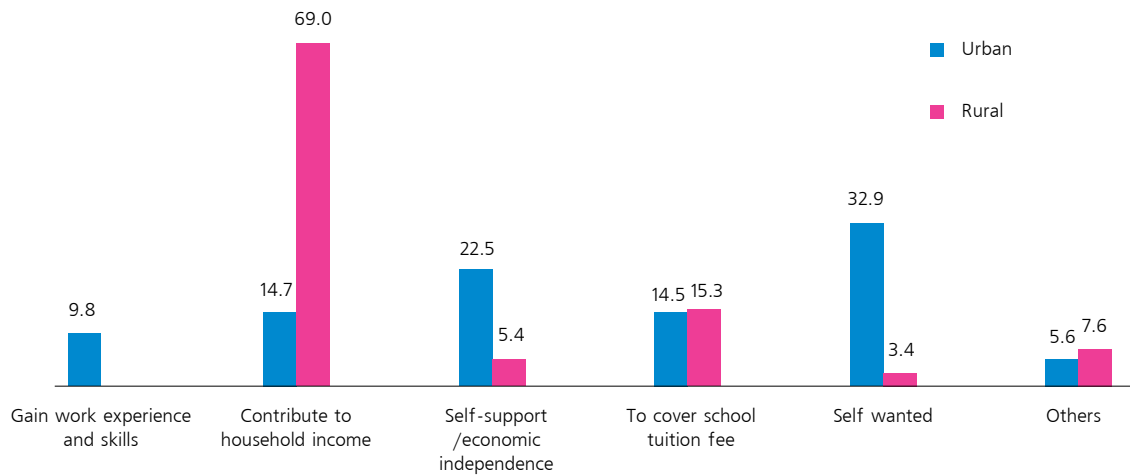

Figure 6.9 shows that reasons for engaging in work outside of household differ by location. It is interesting that seven out of ten rural children responded that the main reason for engaging in work outside of the household was to contribute to household income, while only 14.7 percent of urban children cited this reason. Furthermore, 32.9 percent of urban children cited that the main reason for engaging in work was self wanted, compared to 3.4 percent of rural children. The reasons of “self wanted, self-support, and economic independence” were more often cited by urban children as their main reasons for engaging in work outside household, demonstrating the desire of many urban children to be economically independent.

6.6 CONSEQUENCES OF "IF CHILD STOPS WORKING"

The question about "if the child stops working, what would happen to child or to child's family?" was asked to the survey respondents.

In response to the question of what would occur if a child stopped working, 48.6 percent of children working outside of the household answered that no change will occur, 33.8 percent answered that livelihood will worsen, 11.6 percent said that the household income would be lost, and 6.0 percent responded that it would weaken work experiences and skills.

Table 6.9. Number of children engaged in work outside of the household and consequences of "if the child stops working", by age groups, gender and urban/rural location

		Total	Livelihood will worsen	Loss of household income	Weakening of the work experience and skills	No change
Total		1 857	628	216	110	903
5 - 9		48				48
10 - 11		56	56			
12 - 14		220	100			120
15 - 17		1 533	472	216	110	735
Gender:	Boys	1 554	589	114	110	741
	Girls	303	39	102		162
Location:	Urban	1 059	318	48	58	635
	Rural	798	310	168	52	268
Percentage share						
Total		100.0	33.8	11.6	6.0	48.6
5 - 9		100.0	0.0	0.0	0.0	100.0
10 - 11		100.0	100.0	0.0	0.0	0.0
12 - 14		100.0	45.5	0.0	0.0	54.5
15 - 17		100.0	30.8	14.1	7.2	47.9
Gender:	Boys	100.0	37.9	7.3	7.1	47.7
	Girls	100.0	12.9	33.6	0.0	53.5
Location:	Urban	100.0	30.0	4.5	5.5	60.0
	Rural	100.0	38.8	21.1	6.5	33.6

In terms of gender, the majority of boys answered that livelihood will worsen (37.9 percent) and no change will occur (47.7 percent), while the majority of girls responded that no change will occur (53.5 percent), and household income will diminish (33.6 percent).

Interestingly, 37.9 percent of boys answered that livelihood will worsen, while only 12.9 percent of girls provided the same answer. However, an answer of "no change will occur" was provided by approximately half of both boys and girls (47.7 percent of boys and 53.5 percent of girls).

Reported consequences of the question, "If the child stops working" by the respondents are illustrated in Figure 6.10 by urban/rural location and Ulaanbaatar City.

A majority of urban children, or 60.0 percent reported that there would be no change if they stopped working, compared to only 33.6 percent of rural children. Meanwhile, 30.0 percent of urban children reported that living standards would worsen compared to 46.5 percent of rural children who reported the same answer. This indicates that rural children may be more concerned with potential consequences of stopping work than urban children. Finally, a total of 46.5 percent of Ulaanbaatar City children responded to that livelihood will worsen if they stopped working.

Figure 6.10. Consequences of the question, "if the child stops working", by urban/rural location and Ulaanbaatar City, in percentages

The answer of "household income loss" was provided by only 4.5 percent of urban children, compared to 21.0 percent of rural children as the main consequence for stopping work, indicating that these children are potential breadwinners for their households. Moreover, this answer was not provided by Ulaanbaatar City children, suggesting that breadwinner children are often from aimag centers, soums, and bags.

VII

CHAPTER

WORK PLACE AND ASSESSMENT OF CHILDREN'S WORKING CONDITIONS

7.1 INTRODUCTION

There is a need for broader study of child labour and the subsequent development of programmes that aim to eliminate child labour. In addition to estimating child labour by children’s age and hours spent in work, it is important to analyze the role that children play in work, the conditions of their workplaces, whether the work conditions harm children’s health and development, etc.

Working condition refers to the surrounding environment and the reality of workplace where children and adults work. In other words, it refers to the work process as well as the workplace location. In the 2011/12 CLS, workplace, workplace location and working conditions where children aged 5-17 are engaged in work were analyzed based on survey results.

7.2 LOCATION OF WORKPLACE WHERE CHILDREN AGED 5-17 YEARS ENGAGED IN WORK

Out of 94,000 working children, 72,700 thousand or 77.4 percent were engaged in livestock herding in a pasture/agricultural field; 5,400 or 5.8 percent worked at home with no specific work premises or facilities; 5,300 or 5.7 percent worked at marketplaces and service centers; 3,400 or 3.7 percent worked at home with separate premises or facilities; and 3,100 or 3.3 percent worked in small shops, services, repairs and kiosks (See Figure 7.1).

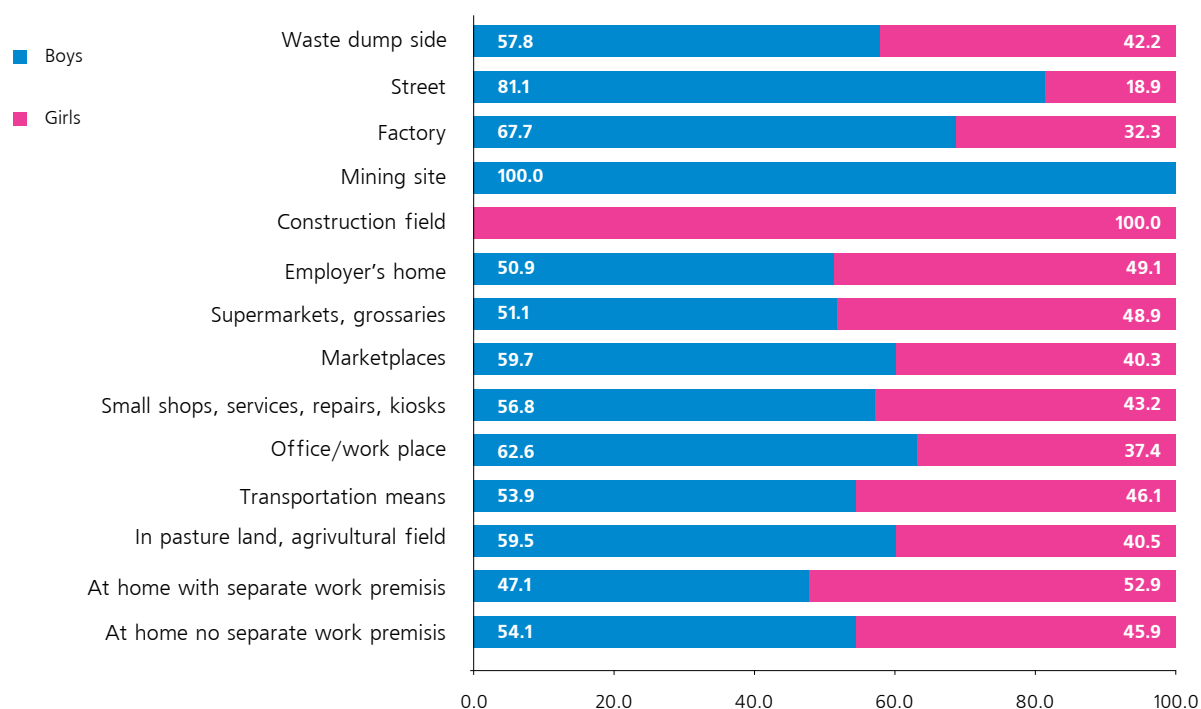

Figure 7.1 Location of work places where children aged 5-17 engaged in economic activities, in percentages

As expected, children of all age groups were engaged in different types of economic activities in various conditions, such as in animal husbandry in agricultural fields; at home with, or without, separate work premises; in small shops, , kiosks, centralized marketplaces and service centers, etc. Children aged 12-14 years worked in transportation means and in the employer’s home, while children aged 15-17 years worked in construction sides, manufacturing, and mining sites.

Figure 7.2 shows location of workplaces where children aged 15-17 engaged in economic activities by gender of children. Boys were working dominantly in manufacturing, waste points, street, and mining, while girls were dominantly engaged in work in supermarkets, grocery stores, centralized marketplaces, and service centers. Findings show that only boys aged 15-17 worked at construction sites, while only girls aged 12-14 worked at an employer's home.

Figure 7.2 Location of work places where children aged 15-17 engaged in economic activities, by gender, in percentages

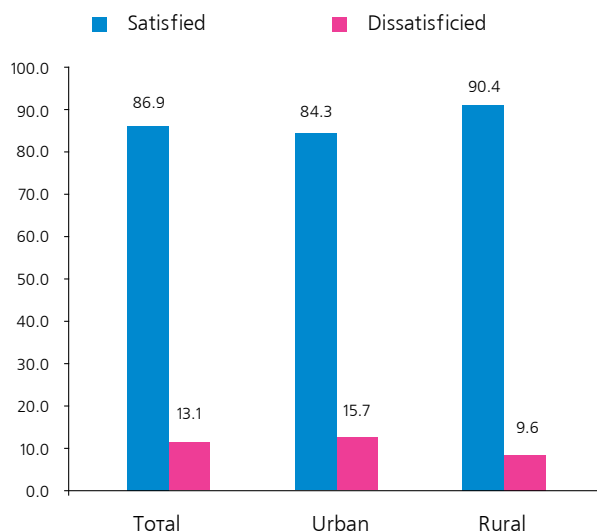

One out of five children who engaged in work outside of the household worked at centralized markets and service centers.

7.3 ASSESSMENT OF WORKPLACE

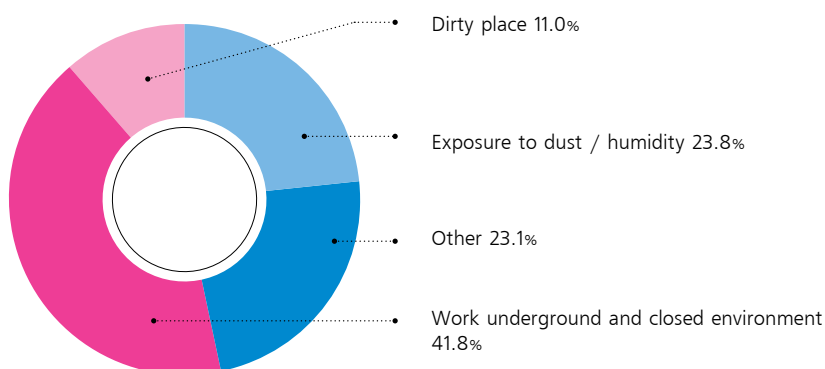

Questions about workplace condition were asked from children who were engaged in work outside of the household. Survey results show that there were 1,857 children or 2.1 percent of working children engaged in economic activities outside of the household. Of these children, 86.9 percent reported that they were satisfied with their working conditions, while 13.1 percent reported to be dissatisfied due to high level of dust concentration, humidity, work underground or in a closed environment and poor hygiene. Out of urban children who worked outside of the household, 84.3 percent were satisfied with their workplace condition. This rate was higher by 6.1 percent (for a total of 90.4 percent) for rural children.

Figure 7.3 Assessment of workplace where children engaged in work outside of the households, in percentages

In terms of reasons for dissatisfaction, 41.8 percent of children stated that they worked underground and in closed environments, 23.8 percent stated that they worked in very dusty and humid conditions, 23.4 percent said that they worked in poor hygienic conditions, and 11.1 percent stated other various conditions.

Figure 7.4 Working children dissatisfied with their workplace condition, by reasons, in percentages

Out of rural working children who expressed their dissatisfaction with their workplace condition, 34.6 percent said that they worked in very dusty and humid conditions, 34.1 percent reported other conditions, and 31.3 percent said that they worked underground and in a closed environment. For urban children, 64.9 percent said that they worked underground and in a closed environment and 35.1 percent stated poor hygiene of their workplaces.

Out of 1,900 working children who engaged in economic activities outside of the household, 93.5 percent reported that they do not experience any physical or psychological assault during work, while 6.5 percent positively to experiencing assault. It is important to note that rural children more often face physical or psychological assault at work when compared to urban children (5.3 percent for urban children, 8.0 percent for rural children).

A majority of children (accumulated number) who experienced physical or psychological abuse at work specifically reported that they were beaten, faced unfair pay, felt overloaded, and scolded and humiliated at work.

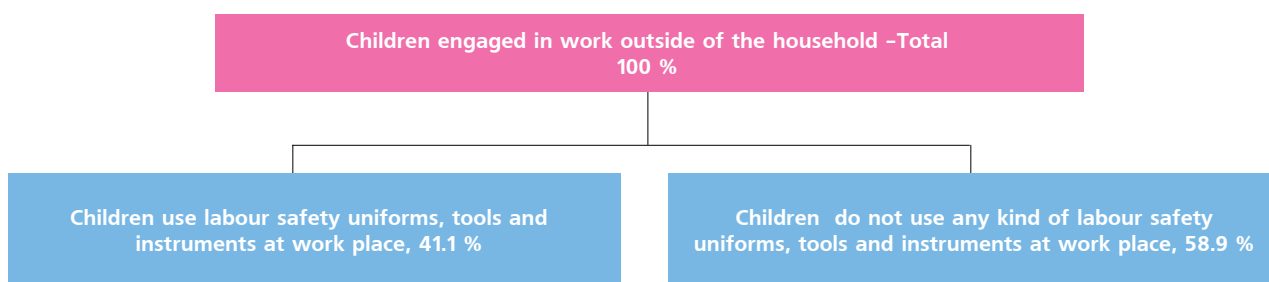

Chart 7.1 Number of children who suffer from physical or psychological abuse (accumulated numbers), types of abuse, in percentage

7.4 PROVISION OF LABOUR SAFETY UNIFORMS, TOOLS AND INSTRUMENTS FOR CHILDREN IN WORK

Out of all children in work outside of the household, 41.1 percent used personal protective equipment while 58.9 percent did not use any kind of personal protective equipment at work.

Chart 7.2 Use of labour safety uniforms, tools and instruments for children engaged in work outside of the households

In terms of occupation, all the children who worked as technicians and assistant specialists used labour protection wear, tools and instruments. Percentages of children who used some kind of labour protection wear, tools and instruments were as follows: 58.3 percent of children engaged in manufacturing, crafts-related work and services; 54.7 percent of children worked in elementary work; 27.3 percent of children worked in agriculture, forestry and fishing; and 16.2 percent of children worked in trading and services.

Figure 7.10 Children use labour protection wear, tools and instruments at work place, by occupation, in percentages

Survey findings show that almost all children who engaged in housekeeping work as helpers, dish washers in hotels, offices and other institutions, used labour protection wear and tools.

VIII
CHAPTER

CHILDREN IN HAZARDOUS WORK

8.1 INTRODUCTION

One of the worst forms of child labour is “hazardous work.” Hazardous work by children is any work activity or occupation which, by its nature or circumstances in which it is carried out, is likely to harm the health, safety or morals of children. These activities include work which exposes children to physical, psychological or sexual abuse; work underground, under water, at dangerous heights or in confined spaces; work with dangerous machinery, equipment or tools or work which involves the manual handling or transport of heavy loads; work in an unhealthy environment which may expose children to hazardous substances, agents or processes, or to temperatures, noise levels, or vibrations damaging to their health; and work under particularly difficult conditions, such as work for long hours or during the night, or work where the child is unreasonably confined to the premises of the employer.

Each country adopts a list of hazardous work in tripartite consultation. The Labour Law of Mongolia prohibits involvement of children in work which will have an adverse impact on the health and morals of a child. The list of designated hazardous occupations, “The list of jobs and occupations prohibited for minors to be employed” was reviewed and approved by the Order of the Minister of Social Welfare and Labour in 2008.

This section presents the estimates of children in hazardous work, measured as: (i) children aged 5-17 years who perform designated hazardous work; and (ii) children aged 5-17 years in work not designated as hazardous but who are at work for 43 or more hours in the reference week. These estimates were made based on the approved “The list of jobs and occupations prohibited for minors to be employed” and “Statistical indicators measurement methodology of employment and labour force.”

8.2. CHILDREN IN HAZARDOUS WORK

Out of 93,968 working children between the ages of 15-17, 11.1 percent or 10,398 children were involved in hazardous and harmful work (Table 8.1). Eighth-tenths of children were boys, and two-tenth was girls.

Table 8.1. Number of children engaged in hazardous work, by age groups and gender

Age groups/ Gender	Involved in hazardous types of economic activities ^a	Children with long working hours ^b	Children in hazardous work situation/ conditions ^c	Children in hazardous work ^d

Female	67	1795	101	1963
Total	773	8507	1118	10398

Note:

a Children engaged in hazardous work prohibited by law.

b Number of children worked 43 and more hours a week.

c Children in work in harmful and hazardous work situations and conditions by law.

d Number of children in hazardous work estimated based on their work conditions, type of work, and weekly work hours.

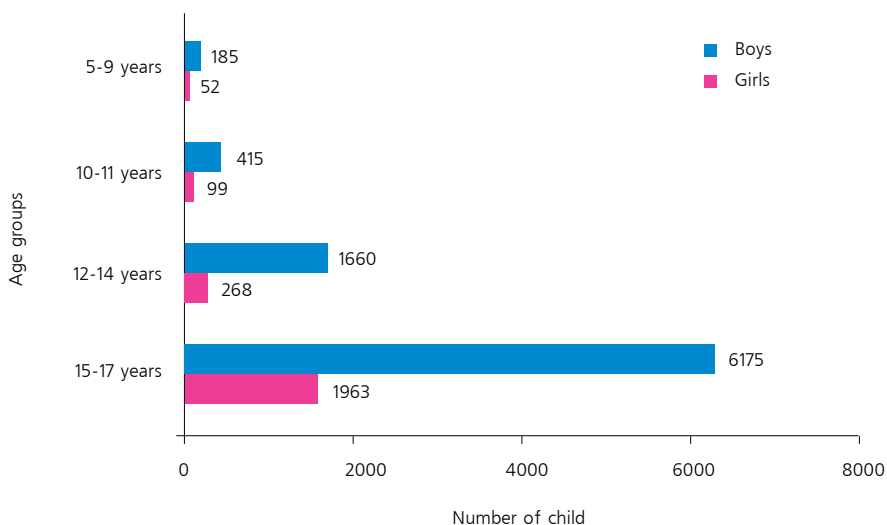

Out of all children engaged in hazardous work, 7.3 percent were children of age of 5-11 years, 18.5 percent were children of age of 12-14 years, and 74.2 percent were children of age of 15-17 years. The age structure of this group of working children is shown in the below figure.

Figure 8.1 Age structure of children in hazardous work, in percentages

The gender and age distribution of children engaged in hazardous work shows that the majority were boys. This trend increases as age rises: four out of five children in hazardous work between the ages of 15-17 were boys (Figure 8.2).

Figure 8.2 Number of children in hazardous work, by gender and age groups

Out of all children in hazardous work, 1.5 percent, or 773 children, were engaged in work prohibited by the Order of the Minister of Social Welfare and Labour in 2008 with “The list of jobs and occupations prohibited for minors to be employed” (See Figure 8.3). One of two children in prohibited work were engaged in food and beverage production, whole and retail trading, and carrying and loading activities.

Figure 8.3 Children in hazardous work, by occupation, in percenteges

Eight out of ten children who worked 43 or more hours a week were boys.

IX

CHAPTER

SEASONAL VARIATIONS IN
CHILD LABOUR

9.1 INTRODUCTION

The main objective of this survey was to estimate the number of working children of age 5-17 years using the current and usual economic activity concept and identify their seasonal variations at the national, rural and urban region. To reach this objective, the sample was sub-divided into 4 equal quarterly rounds with 3-month data collection frequency. Each quarterly round covered 3,204 households, and the results were summarized on an annual basis. Certain indicators were estimated on a quarterly basis.

It should be noted that the survey quarterly rounds are not the same as calendar records. The current survey covered four quarters or one year. Accordingly, the 1st quarterly round extended from July to September of 2011; the 2nd quarterly round covered October to December of 2011; the 3rd quarterly round lasted from January to March of 2012; and the last 4th quarterly round continued from April to June of 2012.

9.2 WORKING CHILDREN AGED 5-17 YEARS

The survey estimated the number of children engaged in economic activities or working children of age of 5-17 years on a quarterly basis (Table 9.1).

Table 9.1 Working children aged 5-17 years, number and percentages, by gender and quarters

Age group/ sex	Quarter 1 (Jul-Sep)		Quarter 2 (Oct-Dec)		Quarter 3 (Jan-Mar)		Quarter 4 (Apr-Jun)	
	Number	%	Number	%	Number	%	Number	%

12 - 14	15 700	32,3	10 770	35,2	12 686	27,0	24 787	32,0
15 - 17	18 347	37,8	13 728	44,9	18 848	40,2	23 353	30,2
Girls	36 921	100,0	22 598	100,0	48 016	100,0	64 859	100,0
5 - 9	5 710	15,5	1 752	7,8	9 910	20,6	14 745	22,7
10 - 11	5 591	15,1	6 225	27,5	7 231	15,1	8 782	13,6
12 - 14	11 300	30,6	7 065	31,3	13 555	28,2	19 915	30,7
15 - 17	14 320	38,8	7 556	33,4	17 320	36,1	21 417	33,0

A comparison of the number of children using current economic activity status suggests that the highest number or 142,278 children worked in the 4th quarterly round or during April-June 2012. In contrast, the lowest number of children was enumerated in the 2nd quarterly round, or October-December 2011. During this period it is difficult to work outside as it marks the coldest period of winter season and most children attend school at this time as the opportunity of work is also limited. The above table shows that child employment in Mongolia significantly varies between seasons. The highest numbers of children were employed during 1st and 4th quarterly rounds or summer and fall seasons, while the most inactive months were counted during winter and spring seasons or the survey's 2nd and 3rd quarterly rounds. The main reason was associated with the schooling season. During the school vacation season, it is common that many children and youth are engaged in economic activities.

The age structure of the economically active children of age 5-17 years was similar during all quarters, and remained the same as the 1st quarter one throughout the time of the survey. During the 2nd quarterly round or October-December 2011, the percentage of working children aged 15-17 years was highest or 40.0 percent, and percentage of working children aged 10-14 years was lowest among all working children.

The below figures demonstrate that the seasonal variations of children's economic activity differ by urban/rural location. Among all working children, the share of rural working children was highest, and varied between 66.8-84.1 percent, of which the highest share was observed in 4th quarter round (84.1 percent). However, the highest share of urban working children was observed in 2nd quarter round (33.2 percent).

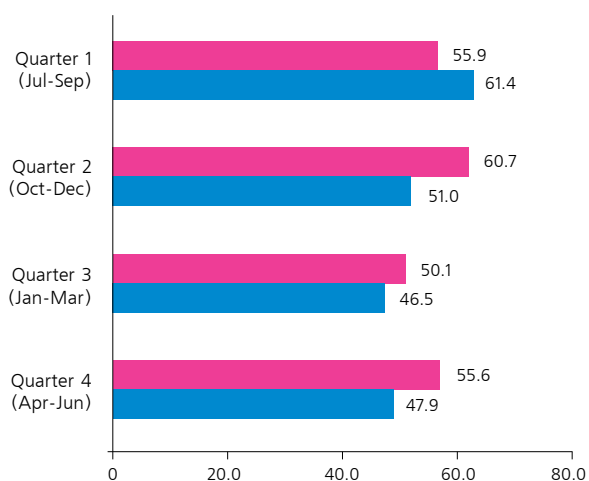

Figure 9.1 Working children aged 5-17 years by urban/rural location and quarters

Working children aged 5-17 years varied by gender between the quarters. The percentage share of urban working boys was highest only in 1st quarter, while the percentage share of rural working boys was highest in the remaining rounds. Opposing however, the percentage share of rural working girls was highest only in 1st quarterly round, while the percentage share of urban girls was highest in all remaining quarterly rounds. In other words, in first quarterly round, the percentage share of urban working boys and rural working girls were highest.

Figure 9.2 Number of working children aged 5-17 years, by gender, urban/rural location and quarters

Boys

Girls

9.2.1 Working children aged 5-17 years, by economic sectors

Table 9.2 shows that the economic sectors where children were engaged in work varied seasonally.

Table 9.2 Working children aged 5-17 years, by economic sectors and quarters

Industry economic activity	Quarter 1 (Jul-Sep)	Quarter 2 (Oct-Dec)	Quarter 3 (Jan-Mar)	Quarter 4 (Apr-Jun)
Agriculture, forestry, fishing and hunting	83,7	72,8	82,5	83,3
Mining and quarrying	0,8	5,2	0,4	0,2
Manufacturing	1,3	0,4	4,6	2,2
Construction	1,6	17,4	0	2,2
Wholesale and retail trade, repair of motor vehicles and motorcycle	10,5	0,3	10,8	11,2
Other	2,1	3,9	1,7	0,9
Total	100,0	100,0	100,0	100,0

In the winter season, or in all quarters except for the 2nd quarter, eight out of ten children were engaged in work in agriculture, forestry, and fishing, while one tenth were engaged in wholesale and retail trade, repair of motor vehicles and motorcycles.

9.2.2. Working children aged 5-17 years, by employment status

The percentage share of children engaged in livestock breeding was highest in all quarters compared to other work activities. This trend is related to the traditions of Mongols, who are engaged in livestock breeding activities throughout the year as it is their primary economic source. Children aged 5-17 years who engaged in household duties with no pay varied by quarters. Nearly two out of five working children were engaged in household duties with no pay during the 1st and 3rd quarters, but this share increased to three out of five in 2nd and 4th quarters.

Table 9.3 Percentage share of working children aged 5-17 years, by employment status

Employment status	Quarter 1 (Jul-Sep)	Quarter 2 (Oct-Dec)	Quarter 3 (Jan-Mar)	Quarter 4 (Apr-Jun)
Paid employee	1,9	2,5	1,5	1,1
Self-employed	3,1	1,3	2,1	3,1
Employed in animal husbandry	75,8	66,0	75,3	63,3
Unpaid family workers	17,9	30,2	21,0	32,1
Workers not classifiable by status	1,3	0,0	0,0	0,4
Total, %	100,0	100,0	100,0	100,0

9.2.3. Working children aged 5-17 years, by occupation

It is important to highlight that a majority of working children age 5-17 years were engaged in agriculture-related activities throughout the quarters.

Figure 9.3 Percentage share of working children aged 5-17 years, by occupation and quarters

Quarterly analysis suggests that for all quarters, children's participation level in agriculture-related activities was high. However, it lowered slightly in the 2nd quarter (October to December), when the participation level of children in trade and services was the highest or 19.8 percent.

9.3 CHILDREN'S FREE TIME

One of the important factors that defines childhood development is how their use their free time. Children aged 5-17 years were asked how much free time they have a day on average to watch TV, play and rest, and what they do during their free time. The answers were analyzed by quarters. Survey results demonstrate that Mongolian children use their free time in various ways.

All surveyed children aged 5-17 years have responded that they do have free time during an average day.

Table 9.4 Working children aged 5-17 years, by intervals of their free time and quarters

	Quarter 1 (Jul-Sep)	Quarter 2 (Oct-Dec)	Quarter 3 (Jan-Mar)	Quarter 4 (Apr-Jun)
Total number of children	617 180	567 311	571 074	600 741
Of which: by hours	617 180	567 311	571 074	600 741
1-2	55 705	75 734	67 300	73 057
3-4	212 808	273 012	235 760	232 515
5-6	204 686	162 836	184 840	194 248
7-8	143 981	55 729	83 174	100 921

The average free time of children varied by quarters as is shown in Figure 9.4. The results demonstrate that 48.1 percent of working children aged 5-17 answered that they had 3-4 hours of free time a day in average in 2nd quarter.

Figure 9.4 Average free time of children aged 5 -17 years, by quarters

X
CHAPTER

**COMPARATIVE ANALYSIS OF NCLS
2002-2003, 2006-2007, 2011-2012 FINDINGS**

10.1 INTRODUCTION

In 2002-2003, the National Statistical Office (NSO) conducted, for the first time, the “Labour Force Survey” combined with “Child Labour Survey”, following the international standard methodology, on a quarterly basis. This nationwide survey enabled the NSO to define the seasonal characteristics of child employment. Using the definitions and methodology developed by the ILO, the survey produced a broad spectrum of information on economic activity of children, as well as the scope and nature of children’s work. The survey served as a foundation for a child employment database. Since then Mongolia has conducted two more CLSs in 2006-2007 and in 2011-2012. This chapter presents the comparative analysis of all three CLSs conducted in 2002-03, 2006-07 and 2011-12.

While the estimates of working children (that is, children engaged in economic activities) are comparable across the three CLSs, the estimates of child labour are to be compared with an element of caution. The reason is that the 2011-2012 survey, in a departure from the previous surveys, has incorporated the estimate of children engaged in hazardous work as specified in the Mongolia Labour and Social Welfare Ministry office order of September 2008¹, in addition to children working for long (43 and more per week) hours for computing child labour and hazardous child labour.

For this reason, comparison of hazardous child labour estimates among the three CLSs is not made, and most of the chapter is based on the comparison of working children characteristics. A brief comparison of the child labour estimates are provided, although, as noted above, the 2011-2012 estimates are strictly not comparable with the previous ones.

10.2 ECONOMIC ACTIVITY OF CHILDREN AGED 5-17 YEARS

The economic activity status of children aged 5-17 years is estimated as current activity or activity during the reference period of the last seven days. Based on this status, all children were classified into four categories such as: children engaged in economic activity, children engaged only in housekeeping activities, children who only studied, and children who were idle.

The findings of the three surveys show an overall increase in children engaged in economic activities. In other words, 9.7 percent of children aged 5-17 were engaged in 2002/03, 11.2 percent in 2006/07, and 16.0 percent in 2011/12.

In terms of age groups, the percentage of children engaged in economic activities increased for all age groups. While the percentage share of working children aged 15-17 years decreased from 2002/03 to 2006/07 by 2.3 points, it increased for all other age groups during this period. In terms of gender, there was an observed increase for both sexes.

The share of children engaged in economic activities were decreasing, as results, the share of children studied was increased. For instance, the share of children engaged in only household duties decreased from 2002/03 to 2006/07 by 10.2 percent followed by a decline from 2006/07 to 2011/12 by 6.1 percent. The same pattern was observed in terms of age groups and gender.

¹ Explained in detail in Chapter 8 earlier.

Table 10.1. Percentage share of working children aged 5-17 years engaged in economic activities, by age groups and gender

Age groups		Total	Engaged in economic activities	Engaged only in household duties	Only studied	Idle	
Total	2002 - 2003	100.0	9.7	74.8	8.2	7.3	
	2006 - 2007	100.0	11.2	64.6	15.0	9.2	
	2011 - 2012	100.0	16.0	58.5	19.4	6.1	
Age groups	5 - 9	2002 - 2003	100.0	6.9	62.0	9.3	21.8
		2006 - 2007	100.0	8.5	47.0	19.5	25.0
		2011 - 2012	100.0	8.8	42.9	31.6	16.7
	10 - 14	2002 - 2003	100.0	7.0	82.9	9.6	0.5
		2006 - 2007	100.0	10.3	73.6	15.2	0.9
		2011 - 2012	100.0	18.0	65.7	15.7	0.6
	15 - 17	2002 - 2003	100.0	17.9	76.7	4.6	0.8
		2006 - 2007	100.0	15.6	73.5	9.4	1.5
		2011 - 2012	100.0	22.3	68.1	8.8	0.8
Gender	Boys	2002 - 2003	100.0	11.6	71.6	8.7	8.1
		2006 - 2007	100.0	13.0	62.2	15.2	9.6
		2011 - 2012	100.0	16.9	56.9	19.6	6.6
	Girls	2002 - 2003	100.0	7.7	78.1	7.7	6.5
		2006 - 2007	100.0	9.3	67.3	14.8	8.6
		2011 - 2012	100.0	14.9	60.2	19.1	5.8

The 2011/12 survey showed that the share of children aged 15-17 years who only studied decreased by 0.6 percent as compared to the previous survey. For all other age groups, the share of children who only studied, and children who were neither engaged in economic activities nor in household duties, increased in past years.

Figure 10.1. Distribution of children aged 5-17 years engaged in economic activities, by age groups based on CLSs of 2002/03, 2006/07 and 2011/12

In 2011/12, the share of children engaged in only household duties decreased to 58.5 percent which is 16.3 percent less than in 2002/2003 and 6.1 percent less than in 2006/2007.

The series of surveys show that the share of boys engaged in economic activities was higher than that of their girl peers (Figure 10.2). For instance, the 2011/12 survey revealed that the share of boys engaged in economic activities was 16.9 percent while the share of girls engaged in economic activities was 14.9 percent.

Figure 10.2. Distribution of children engaged in economic activities during the reference week, by gender, based on CLSs of 2002/03, 2006/07 and 2011/12, in percentages

10.3 WORKING CHILDREN

The 2011/12 survey reveals that out of all children aged 5-17, 16.0 percent or 93,968 children were engaged in economic activities or in work.

Table 10.2. Number and percentage share of working children aged 5-17 years, based on CLSs

	Child Labour Surveys			Percentage shares		
	2002-2003	2006-2007	2011-2012	2002-2003	2006-2007	2011-2012
Total	68 580	71 330	93 968	100.0	100.0	100.0
5-9	15 320	18 116	17 677	22.3	25.4	18.8
10-14	21 407	25 016	42 569	31.2	35.1	45.3
15-17	31 853	28 198	33 722	46.4	39.5	35.9
Boys	41 874	43 037	50 870	61.1	60.3	54.1
5-9	9 005	10 332	9 648	13.1	14.5	10.3
10-14	13 762	14 929	22 653	20.1	20.9	24.1
15-17	19 107	17 776	18 569	27.9	24.9	19.8
Girls	26 706	28 293	43 098	38.9	39.7	45.9
5-9	6 315	7 784	8 029	9.2	10.9	8.5
10-14	7 645	10 087	19 916	11.1	14.1	21.2
15-17	12 746	10 422	15 153	18.6	14.6	16.1

As compared to the previous two surveys, this figure increased by 4.5-5.9, respective to each survey. In terms of age groups, the three surveys revealed that the percentage share of children aged 5-9 years increased to 25.4 percent in 2006/07 followed by decrease of 18.8 percent in 2011/12. The percentage share of children aged 10-14 years has been increasing throughout the survey years, while the share of children aged 15-17 years has been decreasing (Table 10.2).

The percentage share of boys has decreased among working children between the survey years; however, the girls' share has increased.

Figure 10.3. Age structure of working children, based on CLSs

Figure 10.3 shows that the share of children aged 15-17 years was dominant for the previous two CLSs of 2002-03 and 2006/07, while the share of children aged 10-14 was dominant for 2011/12 CLS.

Table 10.3. Working children aged 5-17 years, by economic sectors based on CLSs

	Child Labour Surveys			Percentage shares		
	2002-2003	2006-2007	2011-2012	2002-2003	2006-2007	2011-2012
Total	68 581	71 331	93 968	100.0	100.0	100.0
Agriculture, forestry, fishing and hunting	62 880	63 428	76 762	91.7	88.9	81.7
Mining and quarrying	552	689	328	0.8	1.0	0.3
Manufacturing	701	1 028	2 845	1.0	1.4	3.0
Electricity, gas, steam and air conditioning	...	57	54	...	0.1	0.1
Water supply, used water disposal, waste management, cleaning treatment	218	0.2
Construction	217	928	636	0.3	1.3	0.7
Wholesale and retail trade, repair of motor vehicles and motorcycles	3 148	3 651	11 084	4.6	5.1	11.8
Transportation, storage services	185	328	155	0.3	0.5	0.2
Hotel, housing and restaurant services	353	833	813	0.5	1.2	0.9
Other	545	389	1 073	0.8	0.5	1.1

According to the 2011/12 CLS, the majority of working children or 81.7 percent was engaged in agricultural activities; however, there has been a decline in its share to other sectors as compared to the previous two surveys (Table 10.3). Accordingly, the share of children in manufacturing, wholesale and retail trade, repair of motor vehicles and motorcycles has increased.

Table 10.4 showed that the distribution of working children defined by employment status of 2011/12 survey was different as compared to the previous two surveys. This is due in part to the terminology within a new methodology² as the term "employment status" was used for 2011/12 CLS, while the term of "employment performance" was used for the preceding two surveys. For instance, according to the methodol-

² "Statistical indicators measurement methodology of employment and labour force", NSO and MSWL, 2009

ogy approved in 2002, the head of a herder household was registered as self-employed, and other member of the household were registered as members engaged in household business with no pay. This had in turn created a complication in the registration of people who engaged in livestock breeding activities. Therefore, the new term of "employed in animal husbandry" was introduced by the new methodology. It allowed for a clear distinction between self-employed individuals and those engaged in household business, production and services.

Table 10.4. Working children aged 5-17 years, by employment status based on the Child Labour Surveys

	Child Labour Survey			Percentage share		
	2002-2003	2006-2007	2011-2012	2002-2003	2006-2007	2011-2012
Total	68 580	71 330	93 968	100.0	100.0	100.0
Paid employees	1 154	1 131	1 441	1.7	1.6	1.5
Employer	36	53	0	0.1	0.1	0.0
Self-employed	5652	6 286	2 334	8.2	8.8	2.5
Employed in animal husbandry*	61 955	65.9
Unpaid family workers	61 738	63 860	27 947	90.0	89.5	29.7
Workers not classifiable by status	291	0.3

* Those who are employed in animal husbandry year-round, and get their means of subsistence from income derived from animal or livestock products and raw materials it provides. ("Statistical indicators measurement methodology of employment and labour force", NSO and MSWL, 2009).

The results of three surveys show that overall, the percentage share of children engaged either in self-employment, employed in animal husbandry and unpaid family workers was about the same, with a total of approximately 98 percent.

Table 10.5. Working children aged 5-17 years, by occupation based on Child Labour Surveys

	Child Labour Survey			Percentage shares		
	2002-2003	2006-2007	2011-2012	2002-2003	2006-2007	2011-2012
Total	68 580	71 330	93 968	100.0	100.0	100.0
Technicians and associate professionals			248	0.0	0.0	0.3
Service and sales workers	2 839	3 606	11 659	4.1	5.1	12.4
Skilled agricultural and fishery workers	62 237	60 358	75 643	90.8	84.6	80.5
Graft and related trades workers	1 105	2 486	3 356	1.6	3.5	3.6
Plant machine operators and assemblers	239	166	51	0.3	0.2	0.1
Elementary occupation	1 869	4 118	2 758	2.7	5.8	2.9
Other	291	596	253	0.4	0.8	0.3

Survey findings showed an increase in working children within the trade and services sector. For instance, in 2011/12 the number of children engaged in work in this sector increased by 7.3 percentage points as compared to 2006/07. On the other hand, the percentage share of children working in agricultural sector has been progressively decreasing since the time of the first survey.

Figure 10.4. Working children, by occupation based on Child Labour Surveys

10.4 CHILD LABOUR

Child labour refers to those children who engaged in work during the reference week and is discussed in detail in Chapter 6.

In 2011-12 CLS, out of 75,855 children engaged in economic activities or in work during the reference week, 54.9 percent were employed, which signifies a decrease by 4.2-7.0 percentage points as compared to the previous two surveys. Overall an increasing trend of total children engaged in economic activities was observed over the survey years. However, it is notable that despite an initial increasing trend in child labour, which was observed in 2006/07, had declined by 2011/12.

Table 10.6. Children engaged in economic activities and in child labour based on hours worked during the reference week, by gender, based on Child Labour Surveys

	Child Labour Surveys			Percentage growth/decline	
	2002-2003	2006-2007	2011-2012	2006-2007	2011-2012
				2002-2003	2006-2007
Total surveyed children	679049	621612	589076	91.5	94.8
During reference week:					
Engaged in economic activities	65729	69678	75855	106.0	108.9
Boys	40406	42173	41905	104.4	99.4
Girls	25323	27505	33950	108.6	123.4
Engaged in Child Labour	38856	43159	41654	111.1	96.5
Boys	25445	26746	24487	105.1	91.6
Girls	13411	16413	17167	122.4	104.6

However, the number of surveyed children aged 5-17 engaged in child labour has increased by 0.8 percent as compared to 2006/07.

Figure 10.5. Child labour, by gender, based on Child Labour Surveys

Figure 10.5 shows that the percentage share of girls has increased over the years of the surveys. Specifically, in the 2011/12 CLS, the share of girls in work was 34.5 percent, which demonstrates an increase by 3.2-6.7 percent, respectively for the two preceding surveys. In terms of age groups of children in labour, in 2002/03, the percentage share of three age groups was similar, but changed dramatically for children aged 5-11 within the last two surveys. For instance, the share of children aged 5-11 started at 37.7 percent in 2002/03, increased to 61.5 percent for 2006/07 and was 58.8 percent for 2011/12.

Figure 10.6. Comparison of age distribution of child labour, by age groups based on Child Labour Surveys

The percentage share of children aged 15-17 gradually decreased throughout survey years reaching 15.3 percent in 2011/12 (Figure 10.6).

Figure 10.7. Age and gender distribution of children engaged in child labour based on Child Labour Surveys, in percentages

Overall, survey results demonstrate that gender distribution differs for all surveys. Figure 10.7 shows that throughout the years of the surveys, the age of girls engaged in child labour shifted to the younger age groups. Inversely, child labour has generally risen to older age groups for boys. The share of boys aged 15-17 years was 19.8 percent in 2006/07, and increased minimally to 20.2 percent in 2011/12. The results showed that the age of the girl child laborer is declining.

XI
CHAPTER

SAMPLING ERROR

11.1 INTRODUCTION

The survey sampling unit was a household. The household is defined as a person or a group of people who usually live together and have a common arrangements for food and shelter, such as using a common kitchen or a common food budget. Persons absent from the household for more than 6 months (military servants, students, those living abroad and prisoners) were excluded from the household membership count.

11.2 SAMPLING

Sampling stratification of the current survey was done based on administrative units or all aimags and Ulaanbaatar City Districts. This enables for key indicators of labour statistics to be available by aimags and districts for policy makers. In the survey, 21 strata's were made on a single-grouping for each aimag, 8 strata's for 9 districts of Ulaanbaatar City (two districts with smallest number of households were combined), and in total, 29 strata's were identified, from the lowest administrative units in Ulaanbaatar City khoros and aimag bags, respectively. Kheseqs of khoroo and bags of aimags were selected as the first stage sampling units (FSUs).

For the current survey, a total of 12,816 households were covered, and in every quarter, 3,204 household were newly selected. The sample frame is all households of Mongolia, which were identified from the 2010 Population and Household annual records. At first stage sampling, the list of FSUs was created based on all of the records of aimags, capital City and districts. Each FSU was numbered and selected households were counted. The sampling frame was prepared as a result.

Of course, the number of households very much depended on available financial resources and in the detail of the survey. The data collected from all of the selected 12,816 households should be representative, the standard error of information collected using the structured questionnaire must be within a 5 percent confidence interval, and the coefficient variation must not exceed 1.5.

STRATIFICATION:

In Ulaanbaatar (UB), which has 9 districts, each district constituted a stratum. However, the two smallest districts were merged. Therefore, 8 strata were formed in UB. In the rest of the country, each aimag was treated as a stratum. There were 21 aimags, and therefore 21 strata were formed. Therefore, in total, $21+8=29$ strata were formed.

Stratum 1: All kheseqs of 1st District of UB

Stratum 2: All kheseqs of 2nd District of UB, etc.

.....

Stratum 8: All kheseqs of 8th and 9th Districts of UB

Stratum 9: All bags of Arkhangai aimag, etc.

.....

Stratum 29: All bags of Govisumber aimag

The two stage sampling method was used for this survey.

First stage selection In the first stage selection, first sampling units (FSU's) were drawn from each stratum, and bags and kheseqs were drawn based on probability proportional distribution to size of total administrative units. The percentage share of families with children aged 5-17 years engaged in economic activities to the total households was selected as a meaningful indicator.

The number of households in the enumeration area M_{hi} was used as the measure of size (MOS) in the probability proportional to size method of selection of first stage units. The method of circular systematic sampling with probability of inclusion of an enumeration area proportional to its size (CSSPPS) method was used to select the sample of wards from each stratum. The procedure adopted is described below.

The selection probability for enumeration area 'i' in stratum "h" is given by the formula,

$$P_{hi}^{(i)} = \frac{a_h M_{hi}}{M_h}$$

Where

a_h = number of EA's or PSU's to be drawn from the stratum

M_{hi} = 'i' number of households in the ith EA as reported in the frame

$M_h = \sum M_{hi}$ = total number of households in the stratum as recorded in the frame

The selection of PSU's was performed by arranging the EA's in the "h" the stratum according to aimag, soum, and districts and the estimated number of households was used as the measure of size M_{hi} . The values of M_{hi} were then cumulated and $\sum M_{hi}$ was recorded against each PSU. The sampling interval I_{hi} was computed which is given by

$$I_{hi} = \frac{M_h}{a_h} \text{ rounded to the nearest integer.}$$

A random number " R_h " that falls between 0 and I_{hi} was then selected using the random number generator in the Excel programme. The sequence of " a_h " selector numbers were generated by the addition of I_{hi} to the previous number selected.

$$R_h, (R_h + I_{h1}), (R_h + 2I_{h1}), (R_h + 3I_{h1}), \dots, (R_h + (j-1)I_{h1}), (R_h + (a_h - 1)I_{h1})$$

Second stage selection At second stage sampling, 12 households were selected from each FSUs based on random cyclical systematic sub sampling techniques.

SAMPLING WEIGHTS

The sampling weights are:

$$M_{srj} = \frac{P_s \times H_{srj}}{n_{sr} \times p_{sri} \times h_{srj}}$$

$$M_{sij} = \frac{1}{2} \times \frac{P_s \times H_{sij}}{n_{sr} \times p_{sri} \times h_{sij}}$$

$$M_{tsij} = \frac{1}{2} \times \frac{P_s \times H_{tsij}}{n_{tsr} \times p_{tsri} \times h_{tsij}}$$

Where,

s = subscript for s-th stratum (s = 1-29)

i = subscript for i-th sample kheseg / bagh

j = subscript for j-th second-stage stratum of sample kheseg / bagh

r = subscript for sub-sample (r = 1, 2)

P = total population in a stratum as per the frame
 p = population (size) of the sample kheseg / bagh used for selection
 n = number of sample kheseg / bagh (i.e. number used for tabulation) excluding casualty cases
 H = total number of households listed in the frame
 h = number of sample households available for tabulation

Estimation of variances and Standard Errors

The computation procedure would be incomplete without establishing the procedure for assessing the precision or reliability of the survey estimates. The variances of the ratio estimates will be of the form

$$\text{var}(y) = \sum [(1-f_h) (a_h / a_h - 1) \sum (y_{hi}^2 - y_h^2 / a_h)]$$

Where:

f_h = "h" sampling fraction in strata h
 a_h = "h" to be drawn from the stratum
 y_{hi} = h number of hhs in the i^{th} EA

The standard error of a survey estimate provides a measure of how far the survey estimate is likely to vary from the true population value (i.e. parameter) as a result of having collected the data on a sample basis rather than through a complete census. The standard error [se(y)] of a survey estimate is by definition

$$\text{se}(y) = \text{var}(y)^{1/2}$$

The relative standard error or coefficient of variation (cv), on the other hand provides a measure of the relative variance of a survey estimate; that is the magnitude of the estimated sampling error relative to the magnitude of the estimate itself. Computationally, the coefficient of variation is calculated as

$$\text{cv}(y) = \text{se}(y) / y.$$

The cv that is expressed as a proportional error enables the data user to compare the relative reliability or precision with which different types of survey characteristics have been measured, i.e., means versus proportions, where direct comparisons of standard errors are uninformative since the magnitude of the standard error is dependent upon the magnitude of the estimate.

11.3 SAMPLING ERRORS

There are two types of errors associated with the sample survey namely:

- 1) Sampling errors;
- 2) Non-sampling errors.

The non-sampling errors arise as a result of imperfections in data collection, data processing and disseminating the results. These include errors that are introduced at the preparatory stages, errors committed during data collection, and processing errors.

A series of interventions adopted to prevent occurrence of non-sampling errors. On other hand, due to impracticality of measuring the non-sampling errors are not estimated, while total error calculation in surveys is restricted to estimation of sampling errors only.

Sampling errors in surveys occur as a result of limiting the survey observations to a subset rather than to whole population. The errors are related to the sample size selected and sampling design adopted in the survey. In order to maintain these errors within acceptable levels, the efficient sampling design with the sample allocation was adopted (described in 11.2).

The sampling error indicates the extent to which an estimate from the sample survey would vary by chance, because only a sample of enumeration areas is included rather than all the enumeration areas into which the country is sub-divided. The sample size and survey design had determined the magnitude of the sampling errors. In respect of some items the sampling errors were known to be high at the design stage of the survey.

The survey errors are calculated using the following measures and the main indicator is variation coefficient:

- o The estimated value of the parameter;
- o The standard error;
- o The coefficient of variation;
- o The 95-percent confidence interval; and
- o The number of observations of which the estimates are based upon.

Sampling errors are estimated for main indicators at the national and local level, by urban and rural location, gender, regions and aimags.

Address

A. GENERAL QUESTIONS

1. Type of dwelling
 Ger/tent 1 => A4
 Apartment 2
 Convenient single family house 3
 Single family house 4
 Staff dormitory 5 } => A5
 Other public dwelling 6

2. Number of rooms in the dwelling
 /DO NOT INCLUDE KITCHEN, BATHROOMS AND HALLWAYS/

3. Living area (sq.m) => A5

4. Number of walls in the ger

5. Heating:
 Central heating system 1
 Low pressure stove 2
 Electric heaters 3
 Fire stove 4

6. Ownership of dwelling
 Government organization's 1
 Private:
 Company's 2
 Individuals' 3
 Owner occupied 1
 Rental 2
 Occupied free of rent 3
 Other 4

7. Kind of tenure
 Owner occupied 1
 Rental 2
 Occupied free of rent 3
 Other 4

8. Does household use electricity?
 Yes 1
 No 2 => A10

9. Electricity source
 Central power system 1
 Diesel generation plans 2
 Renewable energy system 3
 Small-sized generators 4

10. Water supply
 Central water supply system 1
 Water station connected with central water supply system 2
 Protected dug well 3
 Protected spring 4
 Bottled water 5
 Water station not connected with central supply system 6
 Tanker trucks 7
 Unprotected dug well/spring/stream/lake/pond 8

11. Does this household own any things?
 Yes No
 11.1 TV 1 2
 11.2 Computer 1 2
 11.3 Fridge 1 2
 11.4 Phone 1 2
 11.5 Automobile 1 2
 11.6 Motorcycle 1 2
 11.7 Tractor 1 2
 11.8 A sun and mind generators 1 2

12. Does this household own any livestock?
 Yes No
 1 2 => A13
 12.1 Horse
 12.2 Cow
 12.3 Camel
 12.4 Sheep
 12.5 Goat
 12.6 Pig
 12.7 Cock, poultry
 12.8 Other

13. Does this household own any land that can be used for agriculture?
 Yes No
